Java-8

=> Lambdas

Functional Programming

those feature that define functional programming

streams

Executor (Future)

Concurrency Collection

Style :

Traditional : Imperative

(HOW)

#exposing the steps how to perform an operation

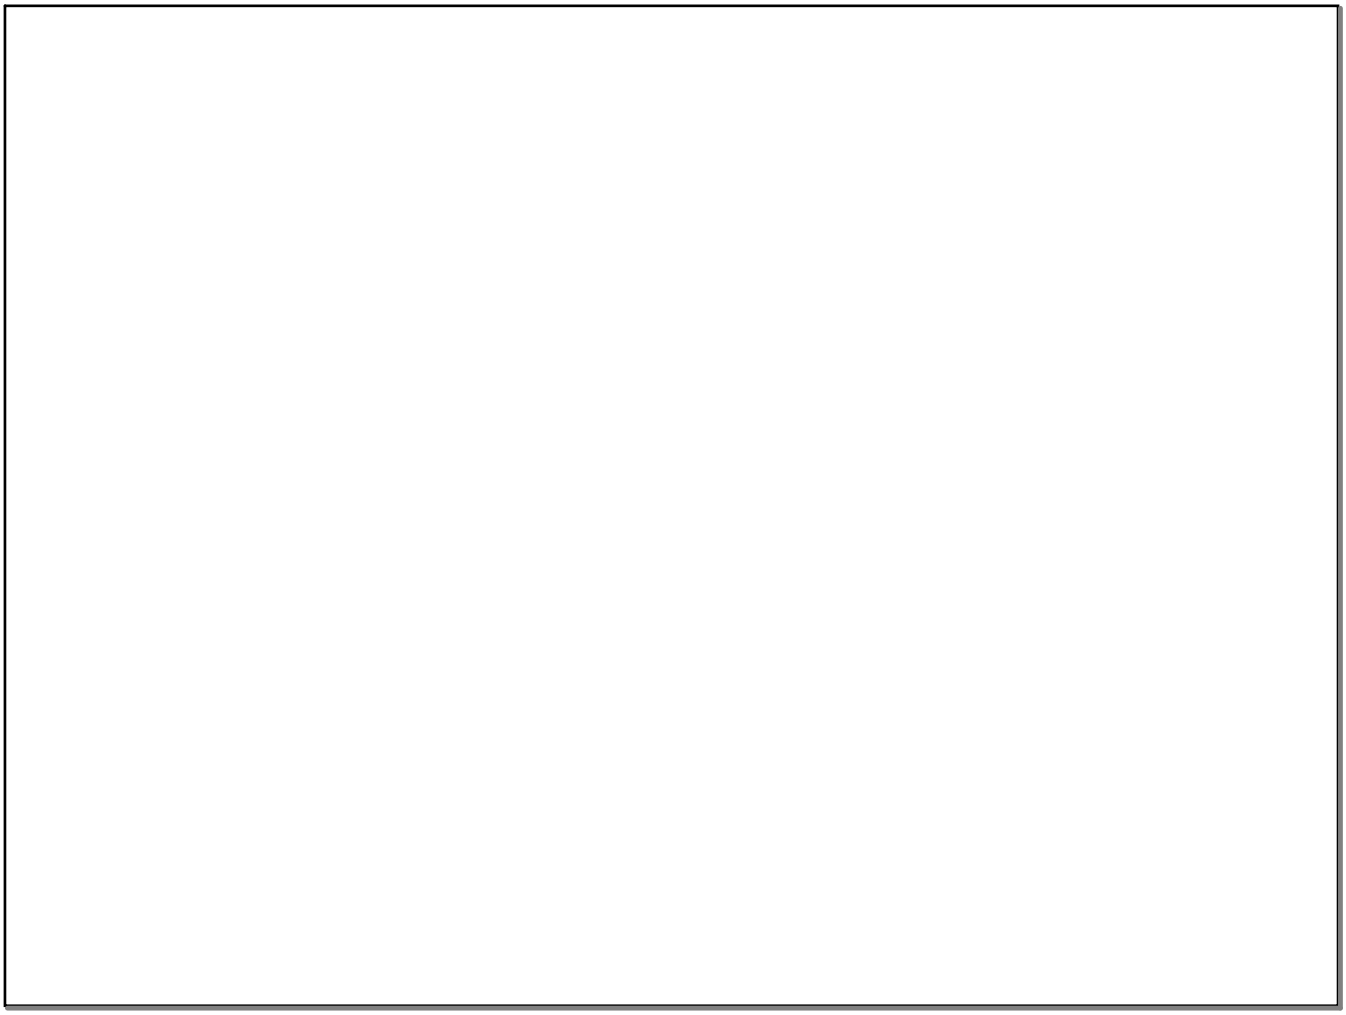
embrace object mutability (not in sync with concurrency)

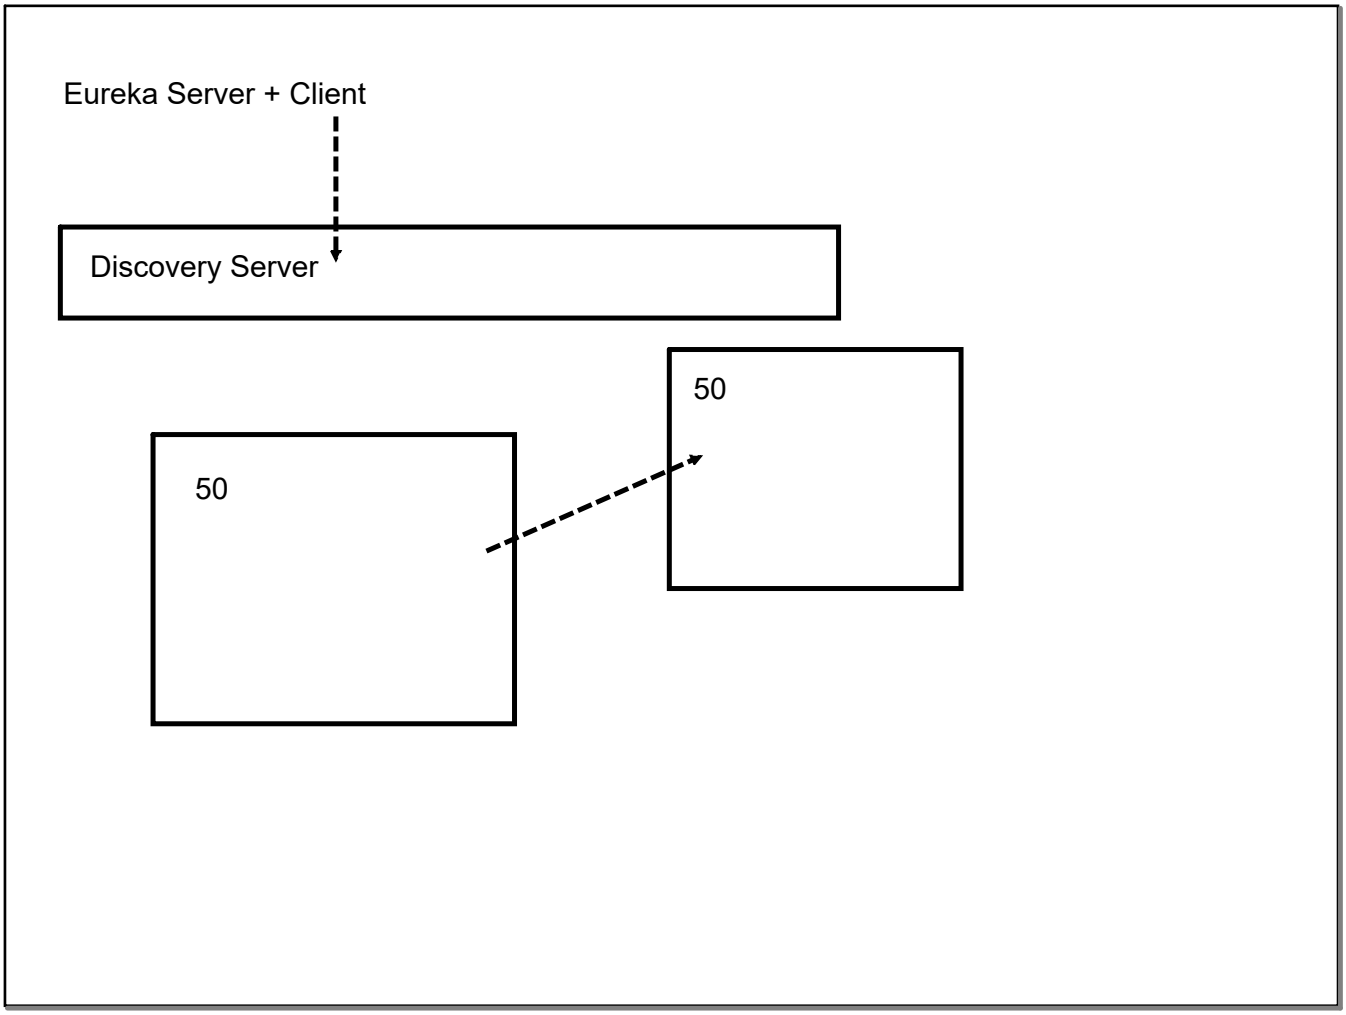
Functional : Declarative

(What) : result

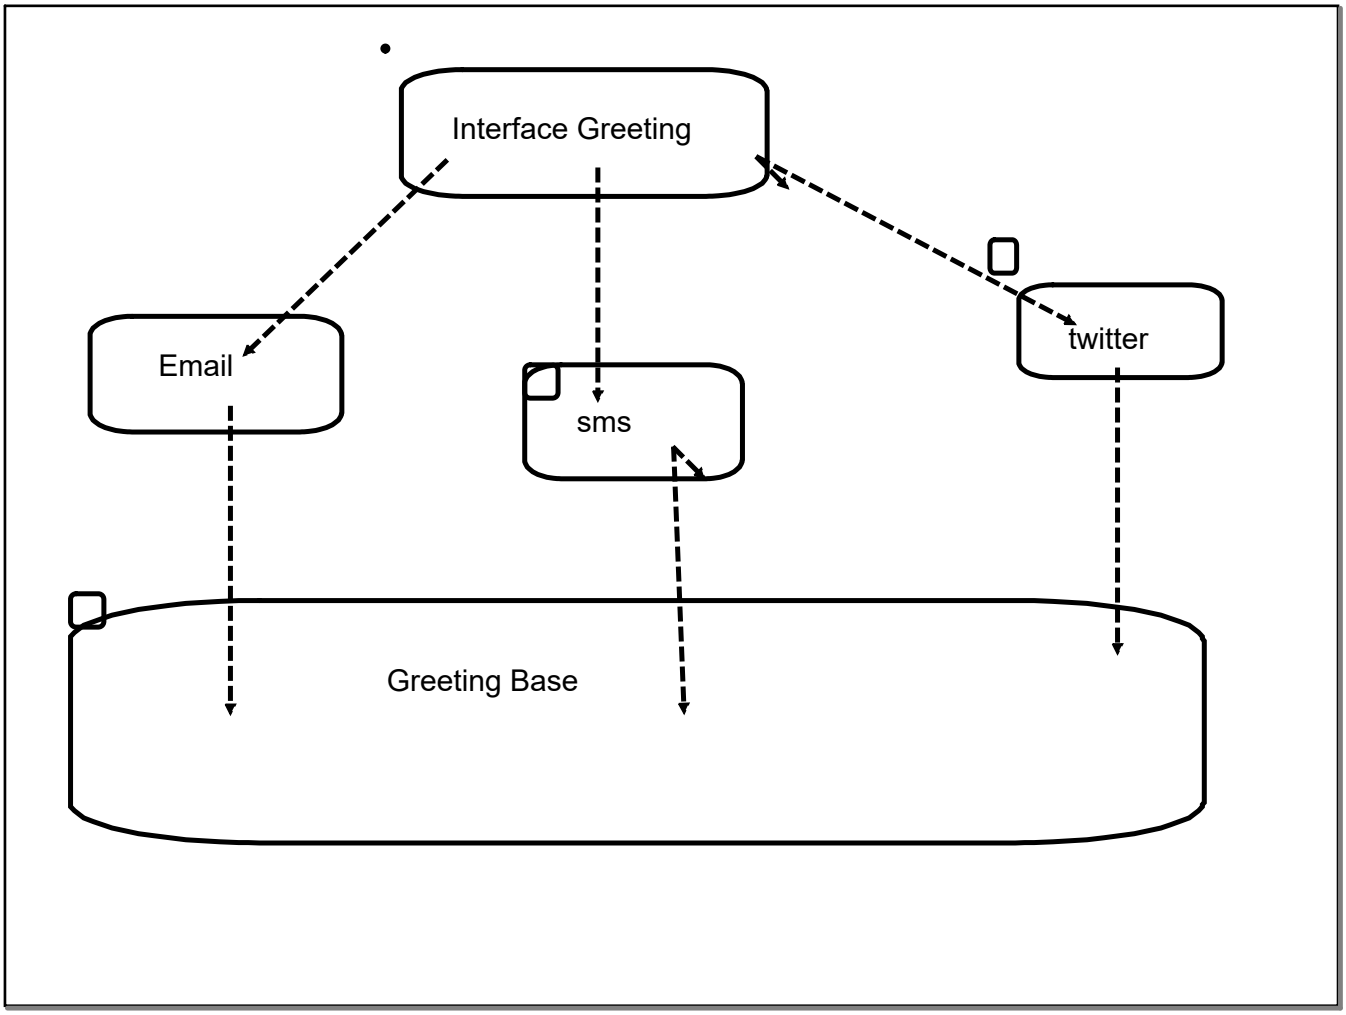
immutability

Analogous SQL





Eureka Server + Client
Discovery Server
50
50



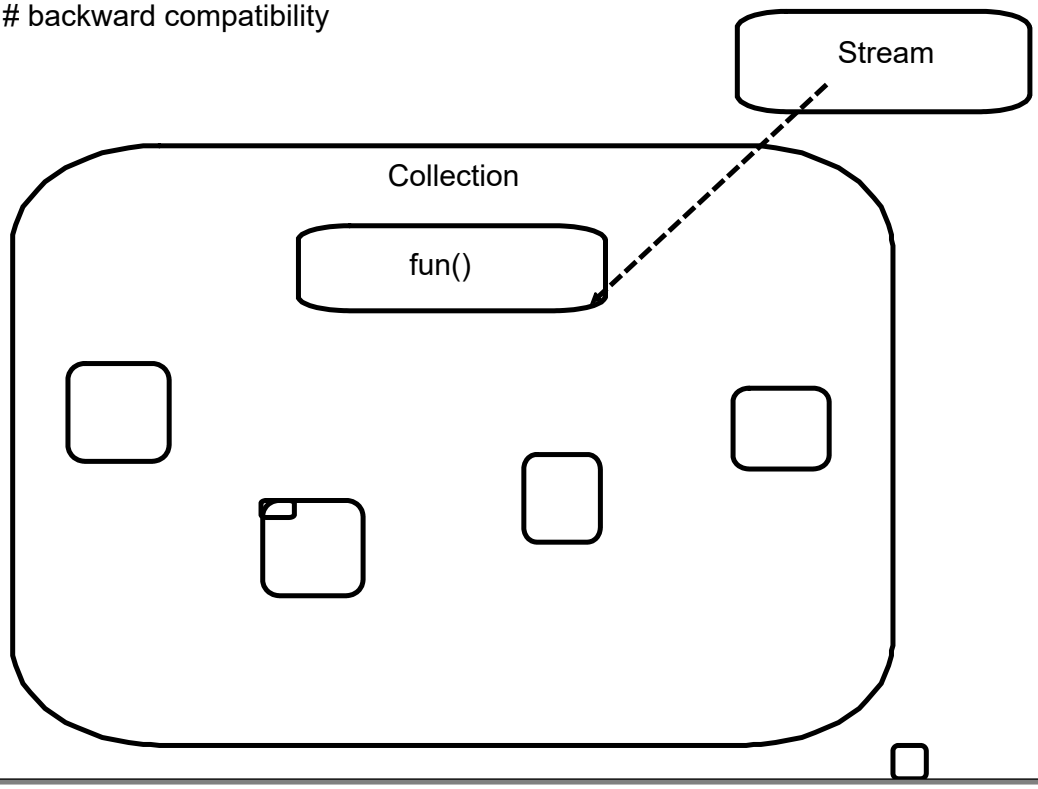
Interface Greeting
Email
sms
twitter
Greeting Base

Interface :

default method (definition)

multiple implementations can be inheritance

backward compatibility



Escape from OOPs

independent Functions (not wrapped inside an object)

Relationship between interface and function

1. interface must have only one abstract method (any number of default/static) :

Functional Interface : Annotation @FunctionalInterface

2. single method signature must match with function implementation

Lambda expression

(<arg1>,<arg2>) -> {

}

arg1 -> {

}

() -> {

}

(<arg1>) -> <return> <single instruction>

(a,b) -> <return>a+b;

(a,b) -> {

return a+b;

}

Pre defined functional interfaces

=> Runnable

=> Comparator

Explicit Functional Interface

Consumer

void accept(<>);

DoubleConsumer() // specialized implementations on primitive

BiConsumer

void accept(<>,<>);

Predicate (test)

boolean test(<>)

Supplier

<> get()

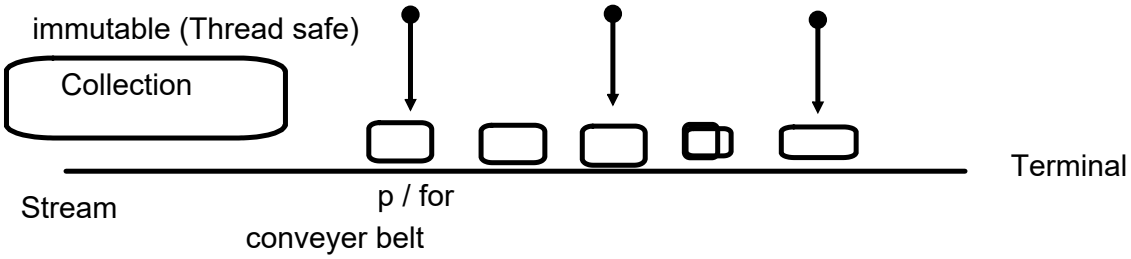
Function

<> apply(<>)

Stream :

not a data structure

immutable (Thread safe)



Stream : LAZY Processes

Stream can have 2 type of activities

intermidiate activities (filter/map/flat map)

Terminal activity : terminate/close the stream

forEach()

collect()

IF terminal activity is not present : stream will not initiate

groupingBy(<return> Function(student))

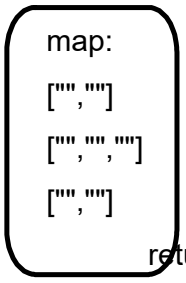
return value : would become a group

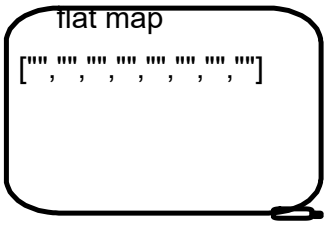
(Stream of) Multiple collection into (Stream of)single collection

Transforms

y map(x)

flatmap() : Collection into stream



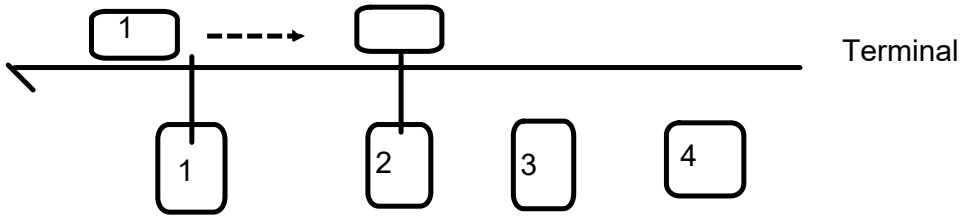


return type fixed : stream of data passed as argument

Stream :

Sequential Stream

Parallel Stream



Parallel Streaming not commended if working on external mutable data (not thread safe)

Activities that are inherently complex

Binary Operator : variant Function

y Function(x) : x and y can be of different type

z BinaryOperator(x,y) : x,y,z : must be of same type

Multithreading :

interleaved (Threaded Multitasking)

1. Multiple activities waiting for I/O : that time can be used by tasks
2. Multi-core architecture of micro-processor

Base Interface :

Runnable (run)

Implementation:

Core Functionality of Multithreading (Thread)

inheriting Runnable

inheriting Thread

Traditional approach:

create, execute, manage

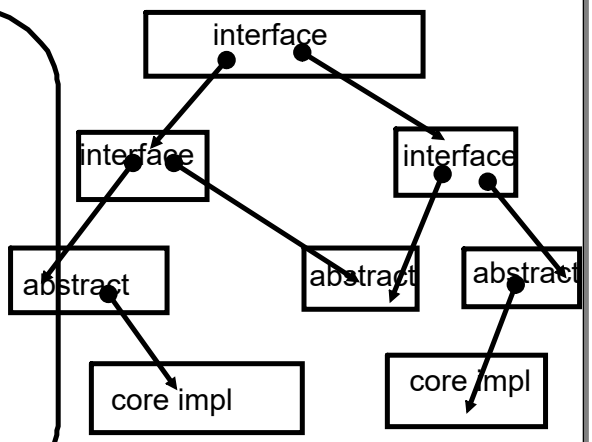
Thread per task

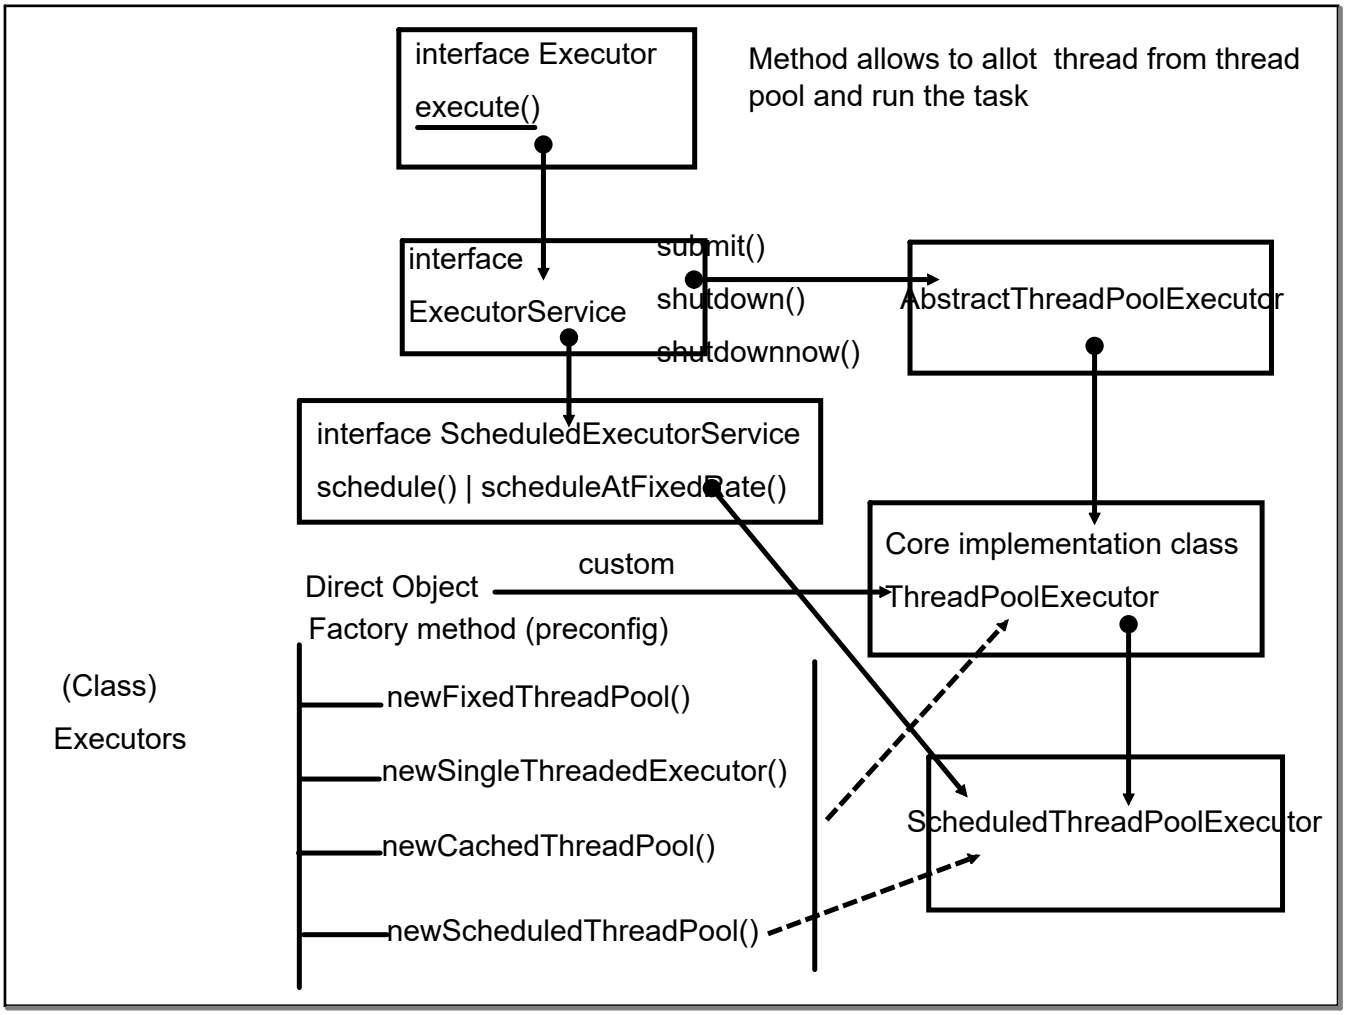
Not possible to keep a track of number of thread

Executor framework :

do all management + improve in performance

ThreadPool : create a predefined pool of thread





interface Executor
execute()
Method allows to allot thread from thread pool and run the task
interface
ExecutorService
submit()
shutdown()
shutdownnow()
AbstractThreadPoolExecutor
interface ScheduledExecutorService
schedule() | scheduleAtFixedRate()
Core implementation class
ThreadPoolExecutor
custom
Direct Object
Factory method (preconfig)
(Class)
Executors
newFixedThreadPool()
newSingleThreadedExecutor()
newCachedThreadPool()
newScheduledThreadPool()
ScheduledThreadPoolExecutor

Need to create instance of ThreadPoolExecutor

FixedThreadPool (number of thread are predefined(extra task alloted will added to queue)

CustomThreadPoolExecutor

<corePoolSize> : number of threads to always keep even if they are idle (2)

<maxPoolSize>: max no of thread (5)

<keepAliveTime> : time to wait before idle thread gets removed/released from thread pool

<TimeUnit> :

<queue capacity>: capacity of queue

<RejectedHAndler> : what to do if a task is rejected from queue

SingleThreadExecutor()

FixedThreadExecutor(1)

can change the thread capacity

CachedThreadPool() : Unbounded ThreadPool : Max Integer Val

if demand decreases : can tear down thread

default keep alive time : 1 min

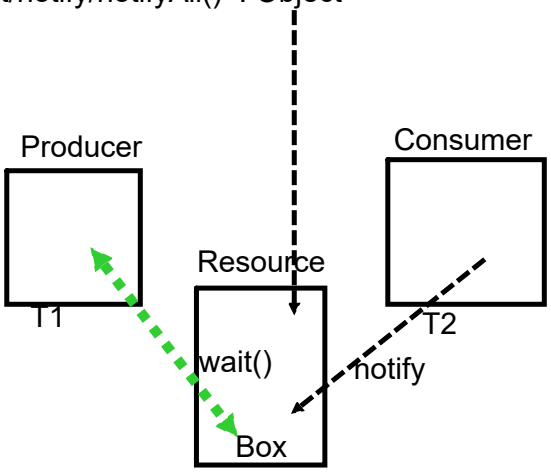
ScheduleThreadPool()

Thread returning some value

Special Interface Callable (call())

ThreadPool can work on Callable

wait/notify/notifyAll() : Object



ExecutorCompletionService

: will going to get results in order of completion of task

Future : blocking

CompletableFuture <callback : logic to follow when task is done>

Functional interfaces

Runnable

Callable

=> Supplier

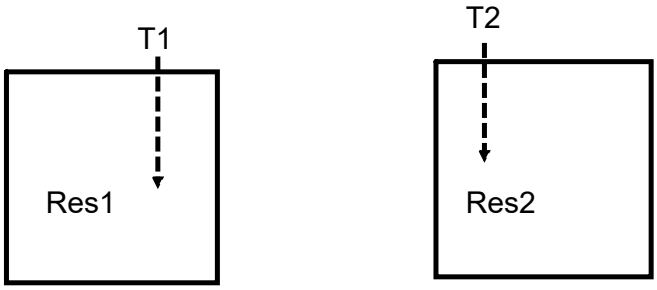
the method to associate a callback function

1. thenApply(Function); // transform
2. thenAccept(Consumer); // consuming and using

CompleatableFuture by default uses the inbuilt thread pool

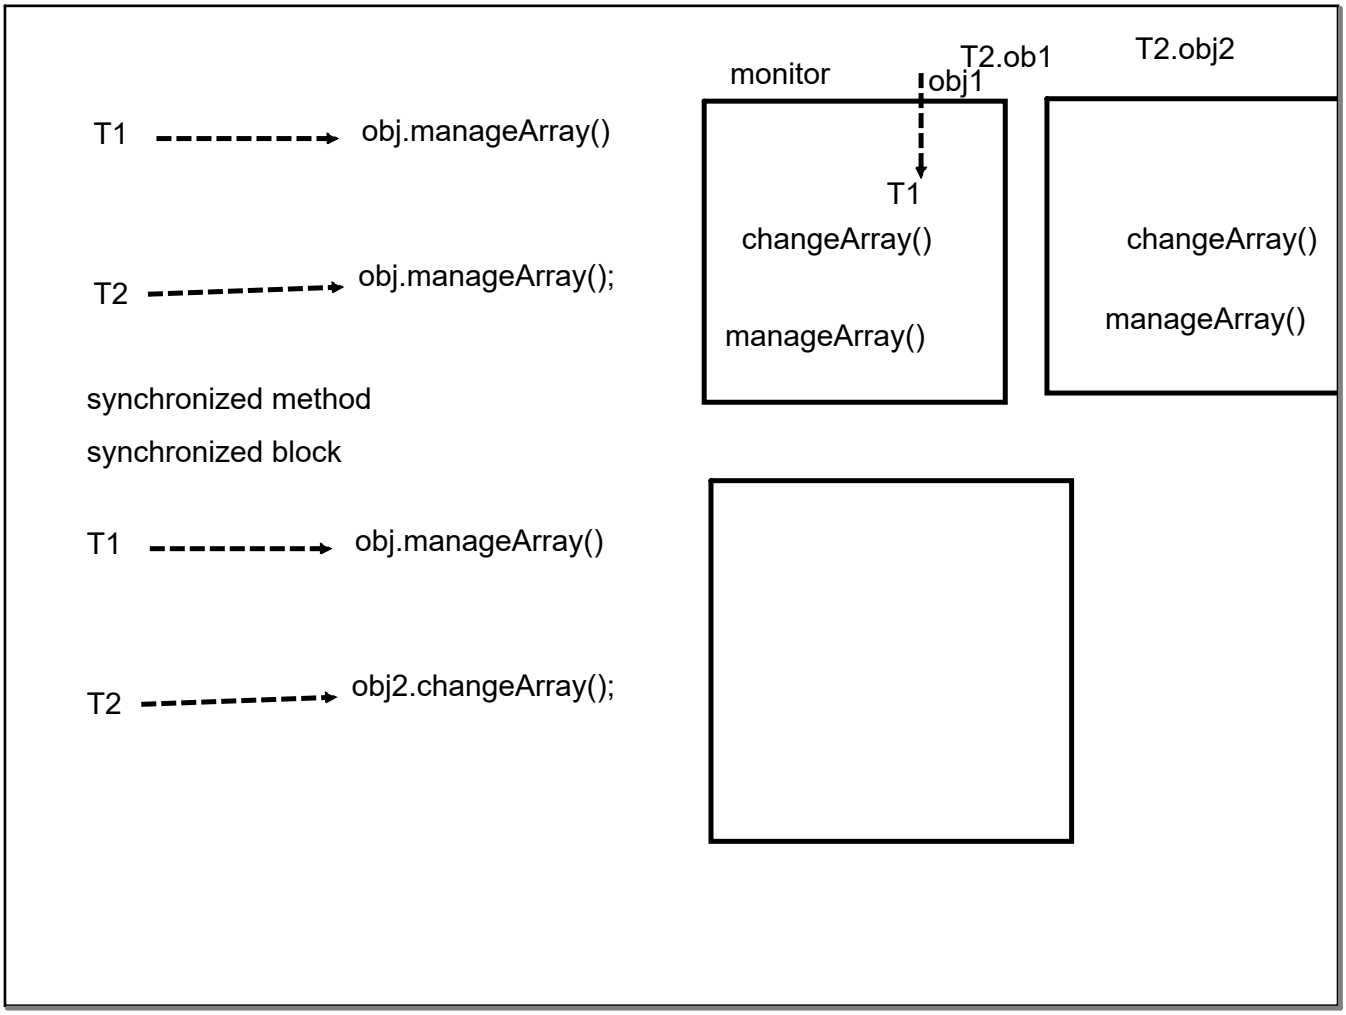
ForkJoinPool.commonPool();

Executor ThreadPool



Common Resource Shared among multiple threads (Thread safe)

Resolve Data inconsistency



T1
obj.manageArray()
T2
obj.manageArray();
synchronized method
synchronized block
T1
obj.manageArray()
T2
obj2.changeArray();
monitor
T2.ob1
obj1
T2.obj2
T1
changeArray()
manageArray()
changeArray()
manageArray()

locking :

=>wide spectrum locking : (synchronized...)

=>granular locking

java.util.concurrent.

API : Granular locking on resources

Collection API

1 .Traditional : 2

1. HashTable
2. Vector

2. To get a Thread safe variant of those class

Collections.concurrentList();

all methods are sync

Atomic operation : single CPU instruction

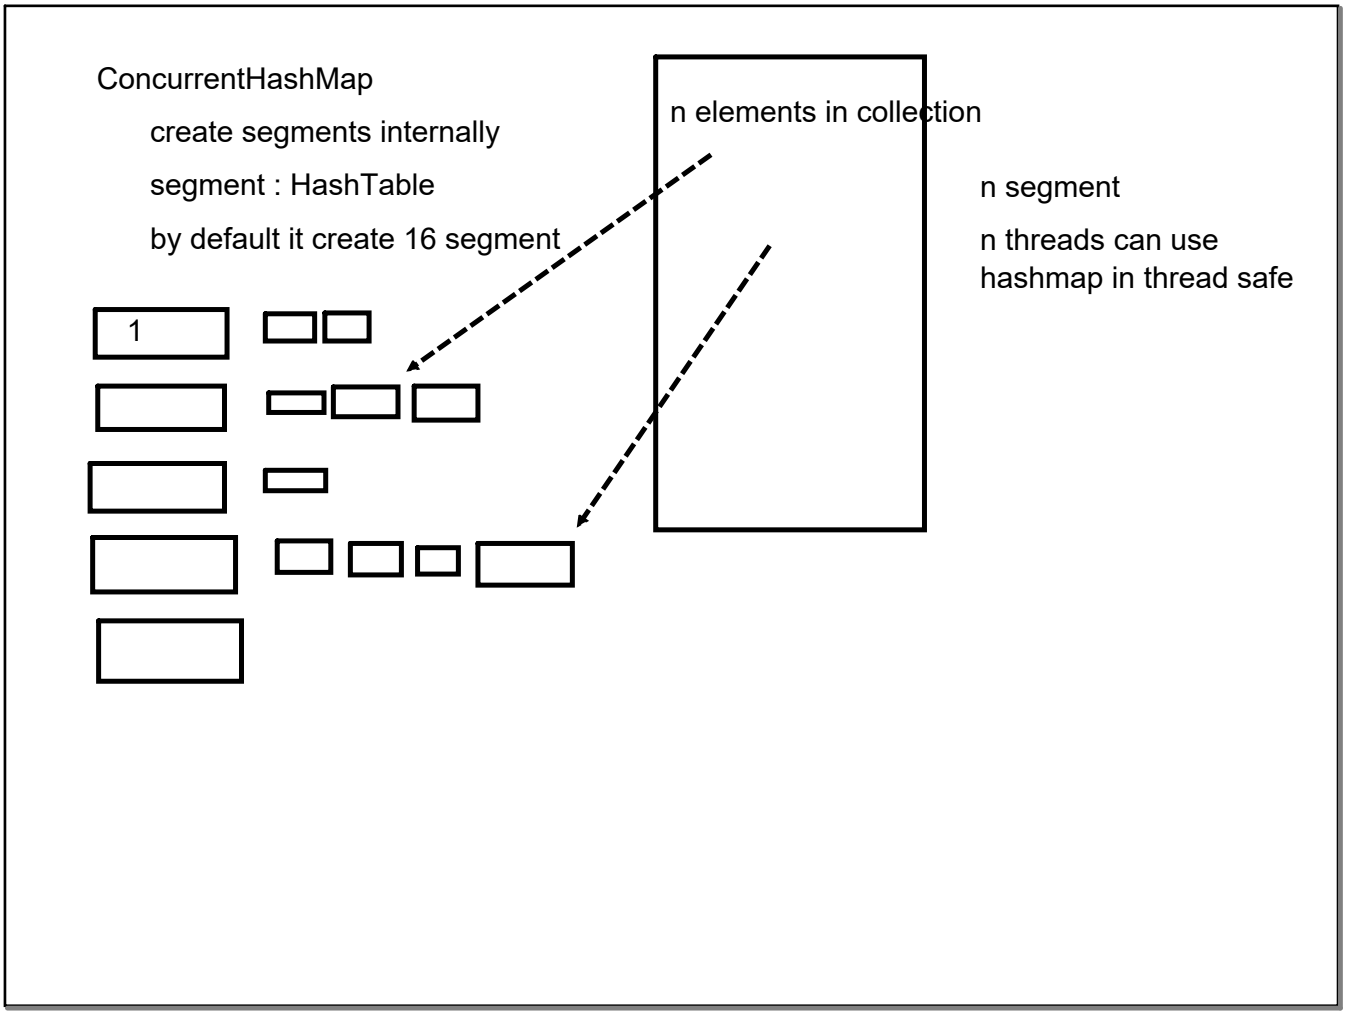
n=10; // Thread safe operations

assignment long/double are non-atomic

Concurent API : Focus on granular locking

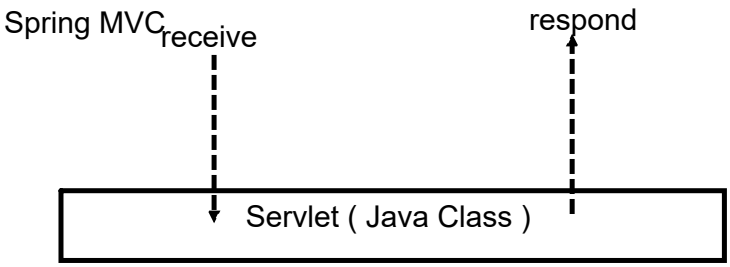
Provides Atomic Variant of type : allow to convert non-atomic activities into atomic

multiple approach for ThreadSafety along with high level of concurrency



ConcurrentHashMap
create segments internally
segment : HashTable
by default it create 16 segment
1
n elements in collection
n segment
n threads can use
hashmap in thread safe

Servlet Technology



How to define java class as Servlet

Extends

HttpServlet/GenericServlet

GenericServlet : does not classifies between various HTTP Verbs

HttpServlet : can identify

GET/POST/PUT/DELETE/PATCH

Life Cycle

=> init

=> generic service() / http (doPost()/doGet()/doDelete()

=>destroy

Servlet Technology

(Controlled By web.xml)

lst request

Multiple request simultaneously

instance of servlet class is created

init phase gets activated

service() (Responsible for receive request/and respond)

Web Servers tends to cache the servlet object

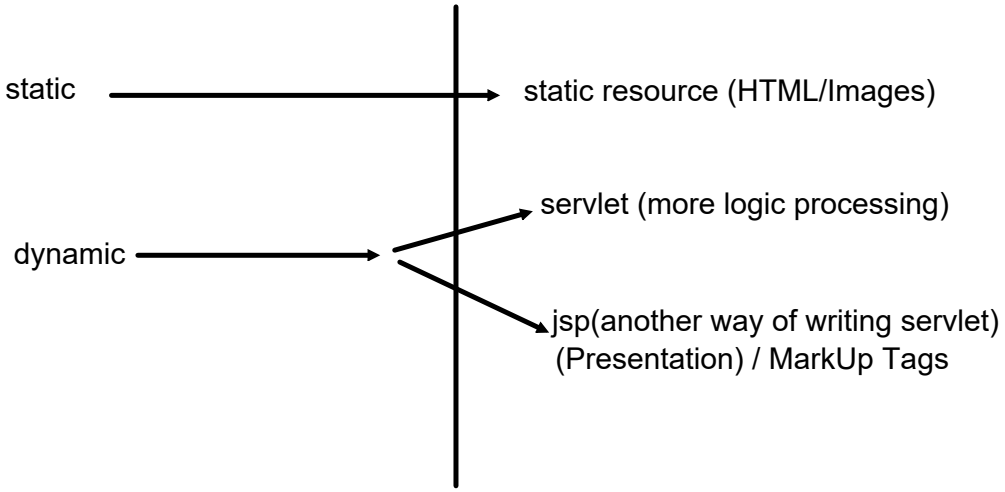
destroy

Object is released

service method and variant

have an access over HttpRequest/HttpResponse object

JSP : another way of writing servlet

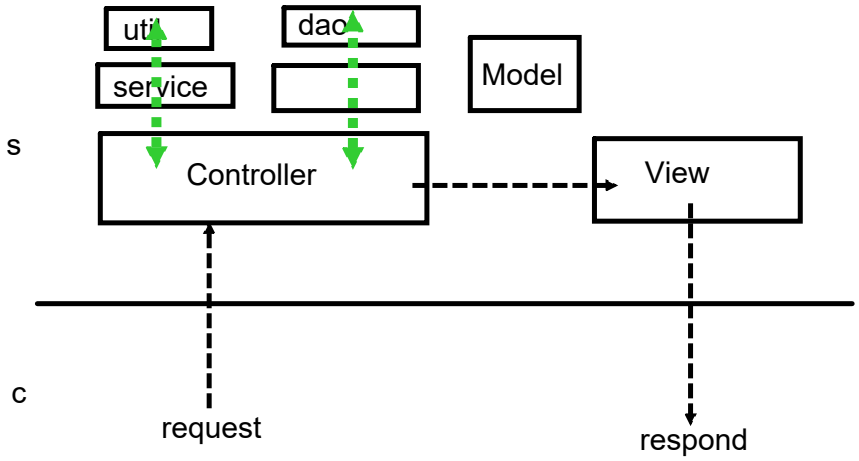


Spring uses Servlet Technology:

But provides a high level abstraction over complexities/ boilerplate req / config and enhances the seperation of concerns

MVC architecture

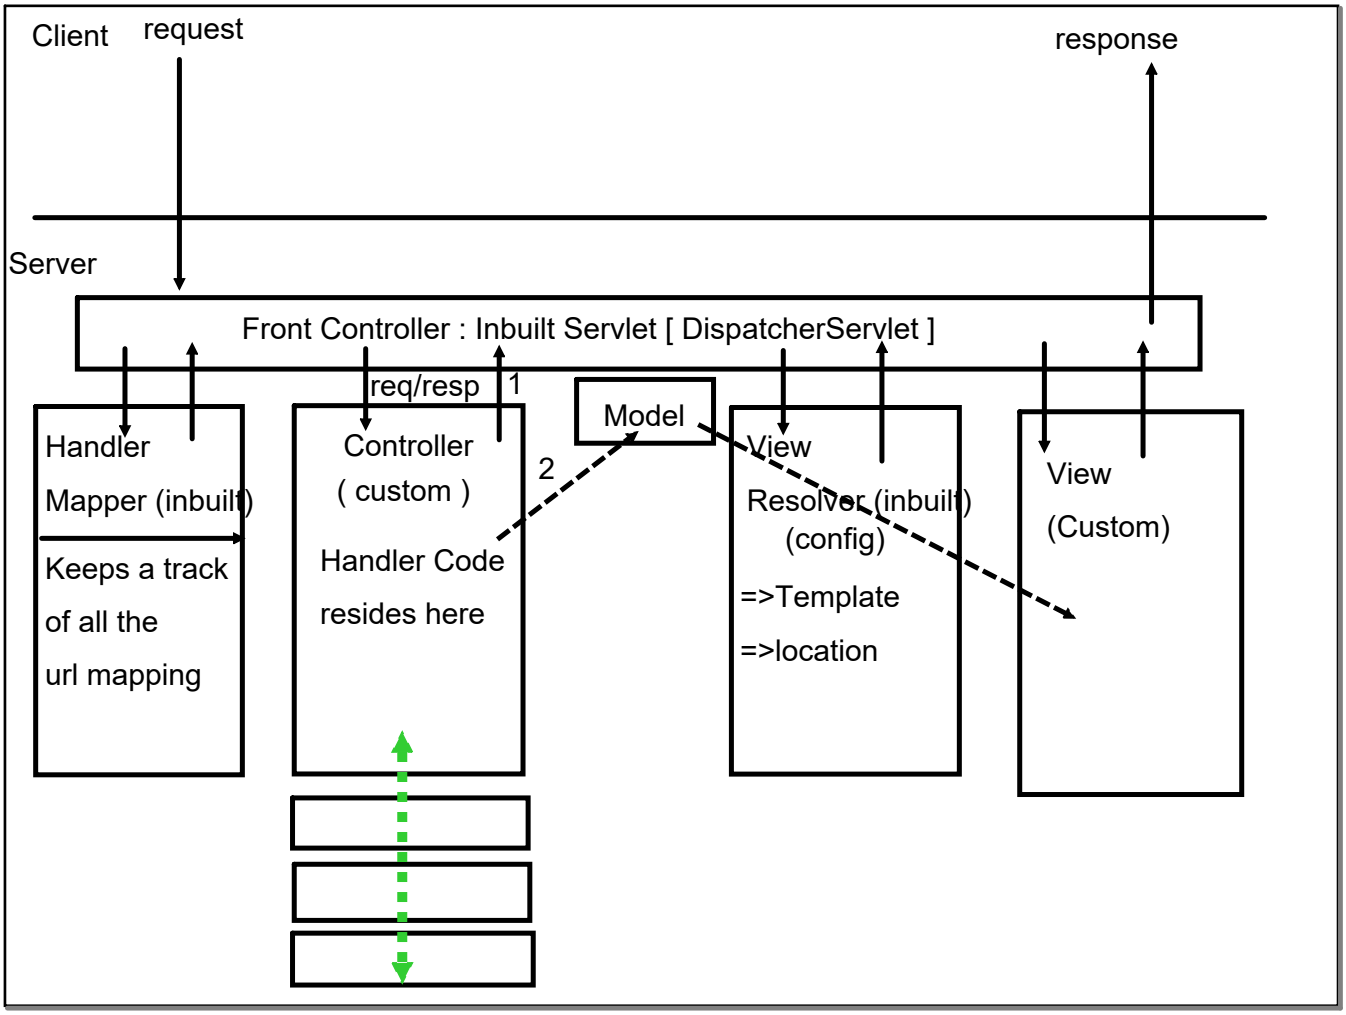
Controller : to receive request / process it



Servlet

service method as task :

assign it to thread



Client
request
response
Server
Front Controller : Inbuilt Servlet [DispatcherServlet]
req/resp
1
Handler
Mapper (inbuilt)
Keeps a track
of all the
url mapping
Controller
(custom)
Handler Code
resides here
2
Model
View
Resolver (inbuilt)
(config)
=>Template
=>location
View
(Custom)

we need to register your app resources (servlet spec)

Servlet :

need to register

registeration can also be done using annotation

Register DispatcherServlet

Config of Spring in place

xml file

java

Need Spring config to connect with DS

xml : <servlet-name>-servlet.xml

Controller : "index"

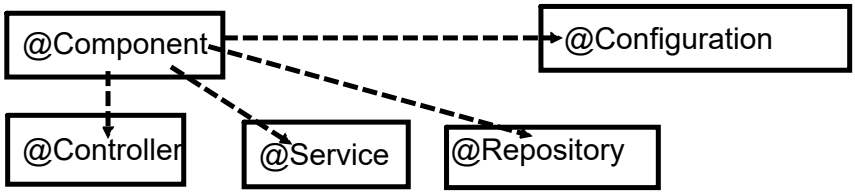
create a complete path

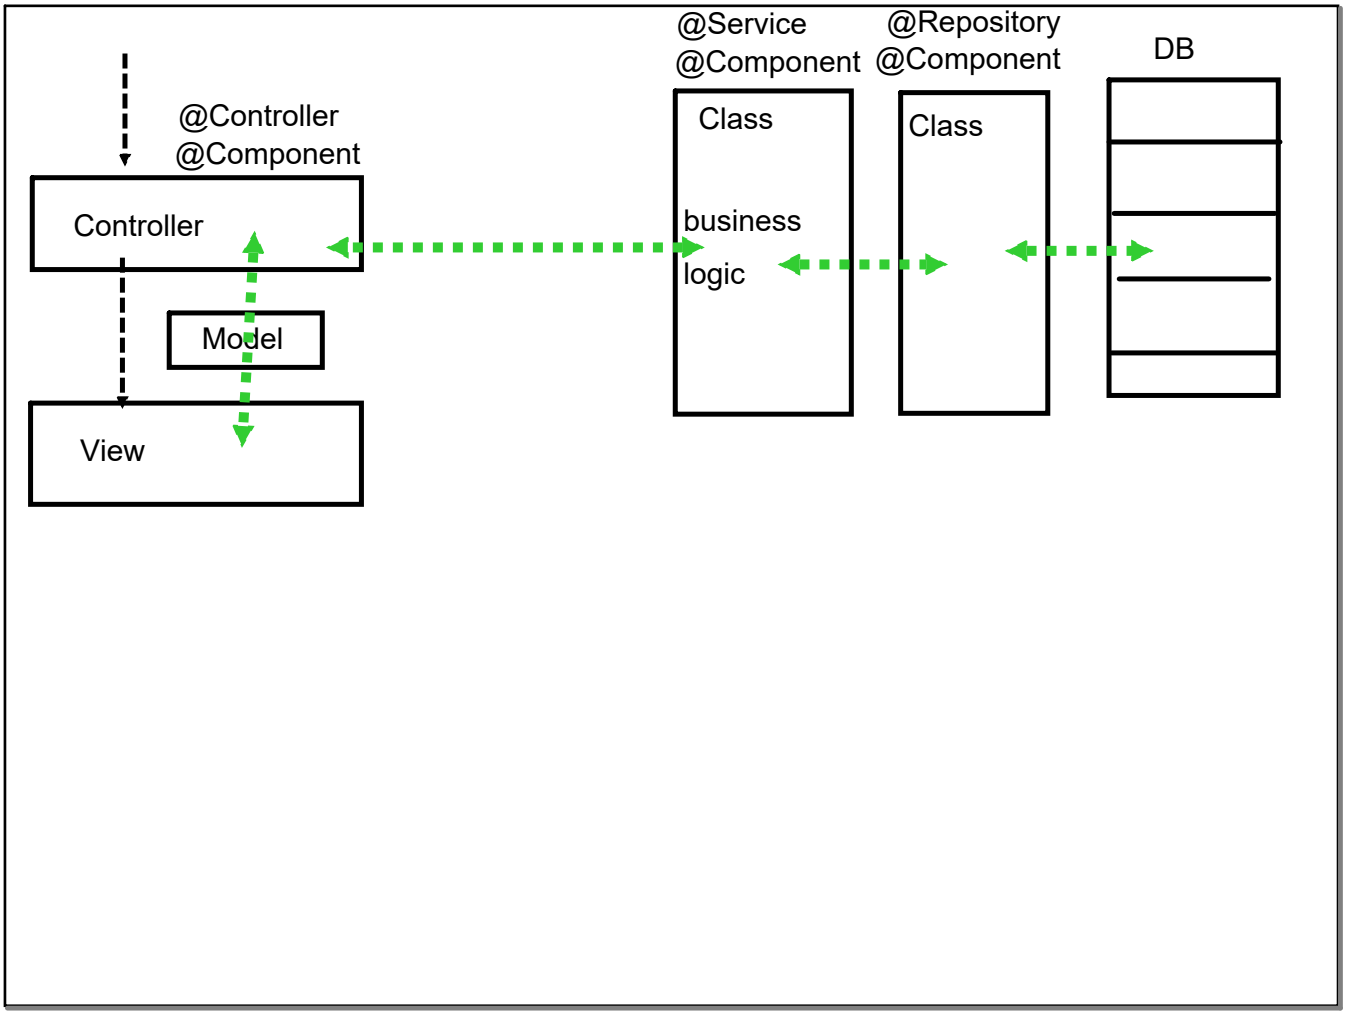
View Resolver : location + template (jsp+jstl) [extension]

```
<bean class="org.springframework.web.servlet.view.InternalResourceViewResolver">
        <property name="prefix" value="/WEB-INF/views/" />
        <property name="suffix" value=".jsp"/>
    </bean>
```

Controller return : "index"

/WEB-INF/views/index.jsp





@Service
@Component
@Repository
@Component
DB
@Controller
@Component
Class
Class
Controller
business
logic
Model
View

web.xml : ~ java config class

dispatcher-servlet.xml : ~ java config class

1. alternate for packaging : maven war plugin

Spring provides an inbuilt class to register DS

Spring-Boot

=> dependency management

=> configuration

dependency management

library + external other resources

spring-boot :

dependency

spring-starter-project

Spring - starter -(parent)project

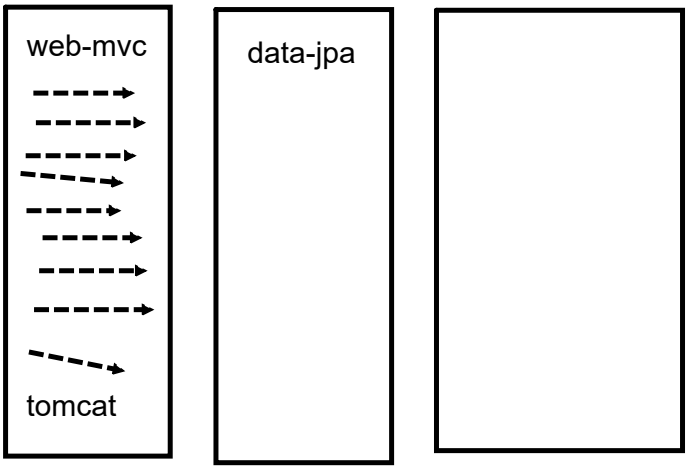
Support of Auto-configuration / less amount of code

manage Embedded Server

Created/Developed

and Launched

stand-alone way



start.spring.io

maven cli
maven command

Configuration
# Spring boot Annotation
# Dependency
# Customization : special file application.properties
key=value
key : predefined keys from different spring projects
: possible values
: custom keys/values
spring : yaml
: heirarchy
: application.yaml

Spring Boot Annotation

curated list of multiple annotation

EnableAutoConfiguration

tracking the dependencies

based on dependencies added:

add default config

expose the key

eg:

maven-web : Spring mvc:

DS servlet

spring-security

add default security

expose username/passed

tracking the properties files

looks for custom key-values pairs

defined in config-file

cli : key-values

mvc application

- controller
- view

pre-configured to use thymeleaf

View pages :

View Templates

Jsp-jstl

Thymeleaf

Mustache

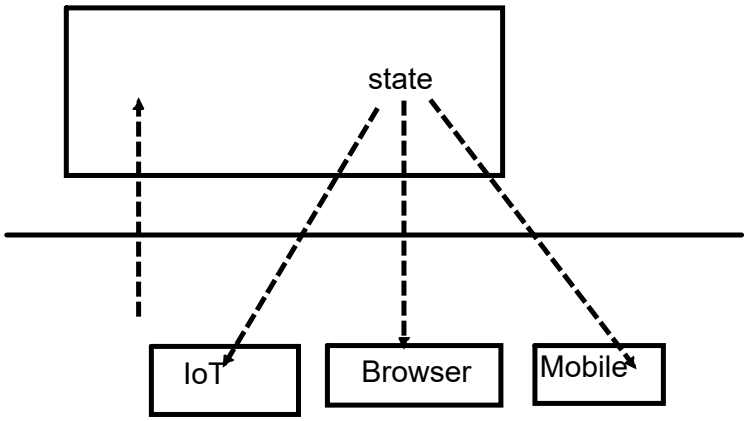
FreeMArker

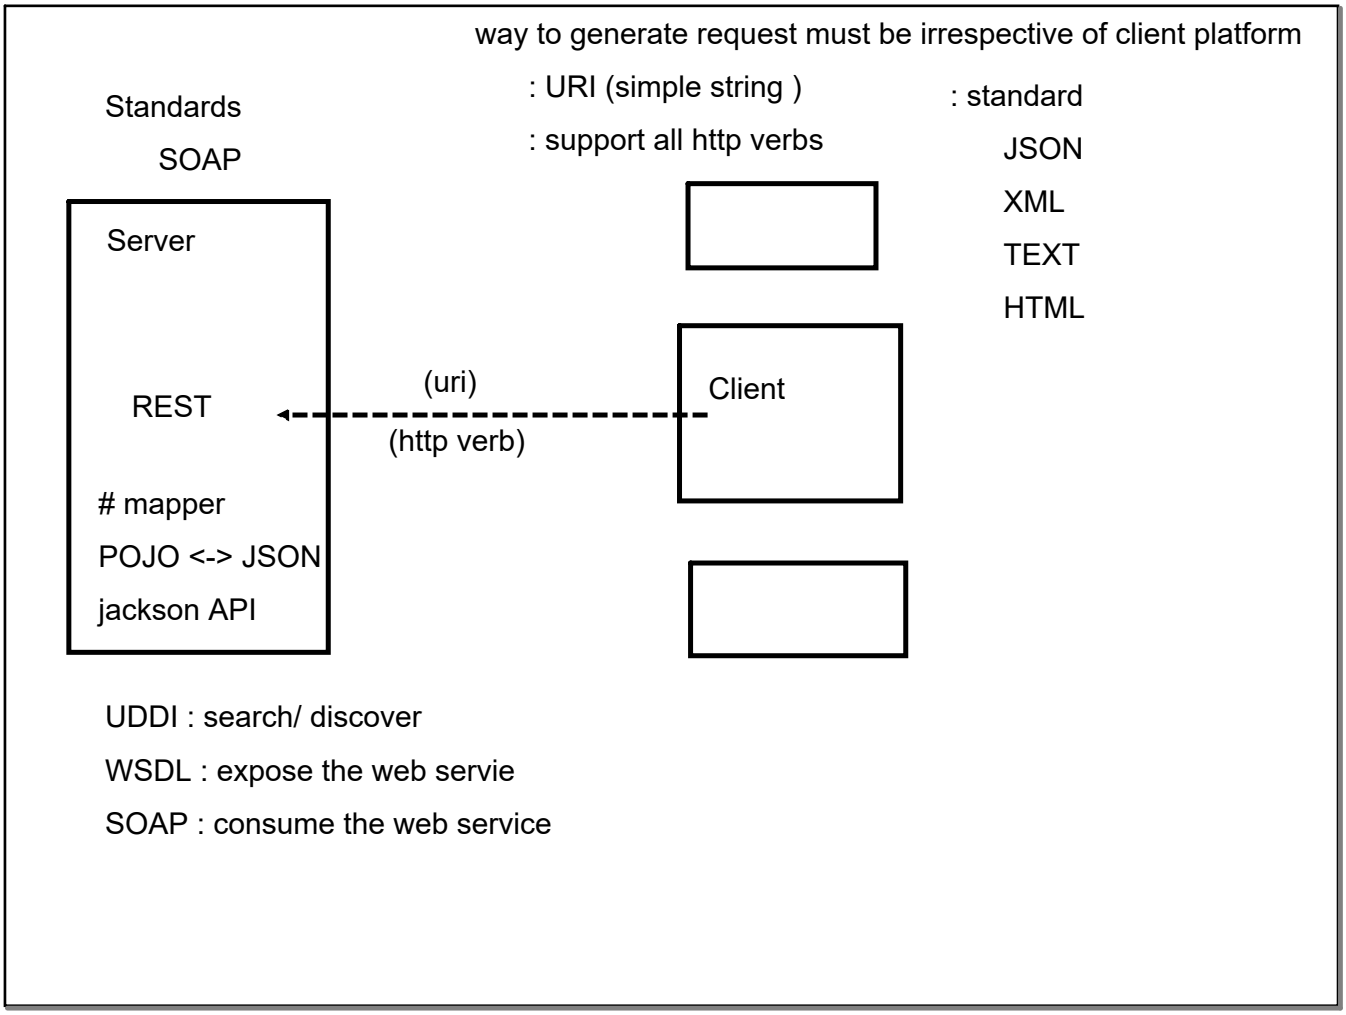
Tile

Velocity

Rest Based service

exposing server based info as Rest Service





way to generate request must be irrespective of client platform
: URI (simple string)
: support all http verbs
: standard
JSON
XML
TEXT
HTML
Standards
SOAP
Server
REST
# mapper
POJO <-> JSON
jackson API
(uri)
(http verb)
Client
UDDI : search/ discover
WSDL : expose the web servie
SOAP : consume the web service

@RestController : interconversion take care of

client intention

GET : data retrieval

POST : add new data

PUT : edition

DELETE : delete

Student /student

/getAll

Employee /employee

/getAll

@RestController : auto needs mapper in classpath (jackson)

@Controller

add mapper to classpath

produce

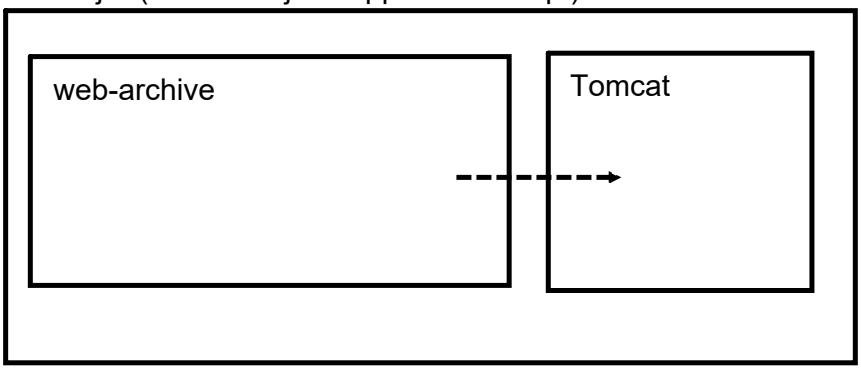
consume

@ResponseBody : content to be shared directly to client

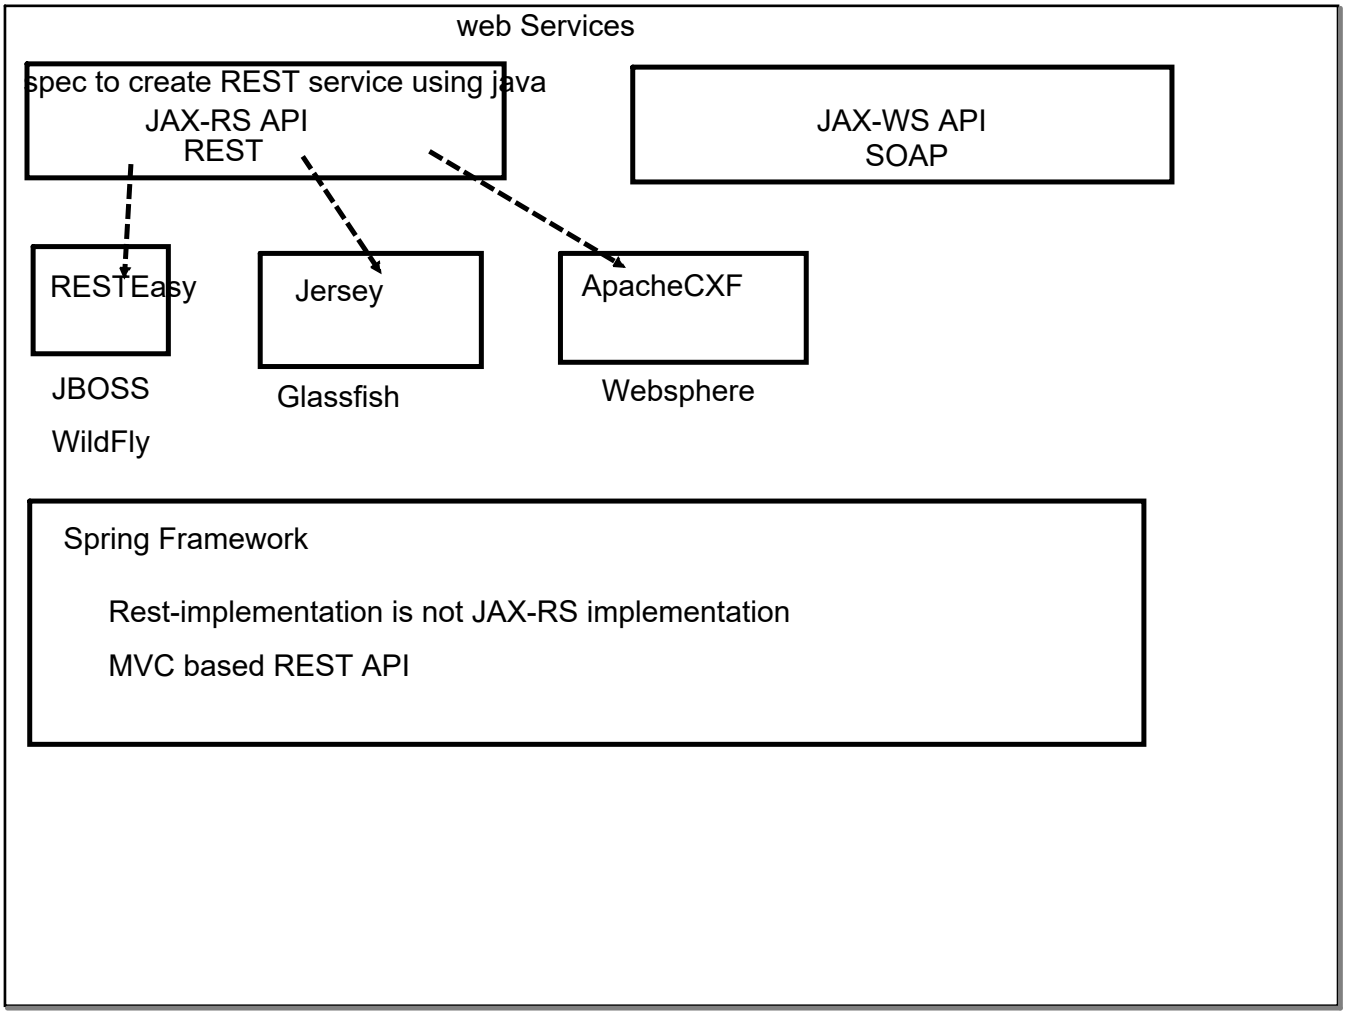
1.launch tomcat

2. deploy web-archive over tomcat

jar (additional java app build on top)



dev-tools: live reloading of server



web Services
spec to create REST service using java
JAX-RS API
REST
JAX-WS API
SOAP
RESTEasy
Jersey
ApacheCXF
JBOSS
WildFly
Glassfish
Websphere
Spring Framework
Rest-implementation is not JAX-RS implementation
MVC based REST API

actuator : exposes rest endpoint

Microservice architecture implements

Dividing a single large sized monolith application into
multiple smaller (independent) application

microservices : responsible to expose a particular service

DataDriven/Rest based

Stateless

Service Oriented Architecture : SOA :

Microservice : + technology/approach/design pattern

Monolith issues

involve light wight VS for deploying service components

Deployment :

Multi-Technology service component

DB : ideally must be using independent DB

Scaling : individual service comp

Robust in implementation

Design Guideline : MS (12 factor)

Design Pattern

Lightweight : concern/runtimes/data exchanging

Reactive : highly concurrent/longer processing

Stateless: scale better

Atomic : core design principle

Externalized config : config server

Consistent : style

Resilient : eliminate bottleneck

Good Citizens : expose usage statistics

well versioned :

Design Pattern:

Decompositions :

a) business capabilities

business-oriented rather than technical

b) sub-domain (technical)

domain class (parent/God classes)

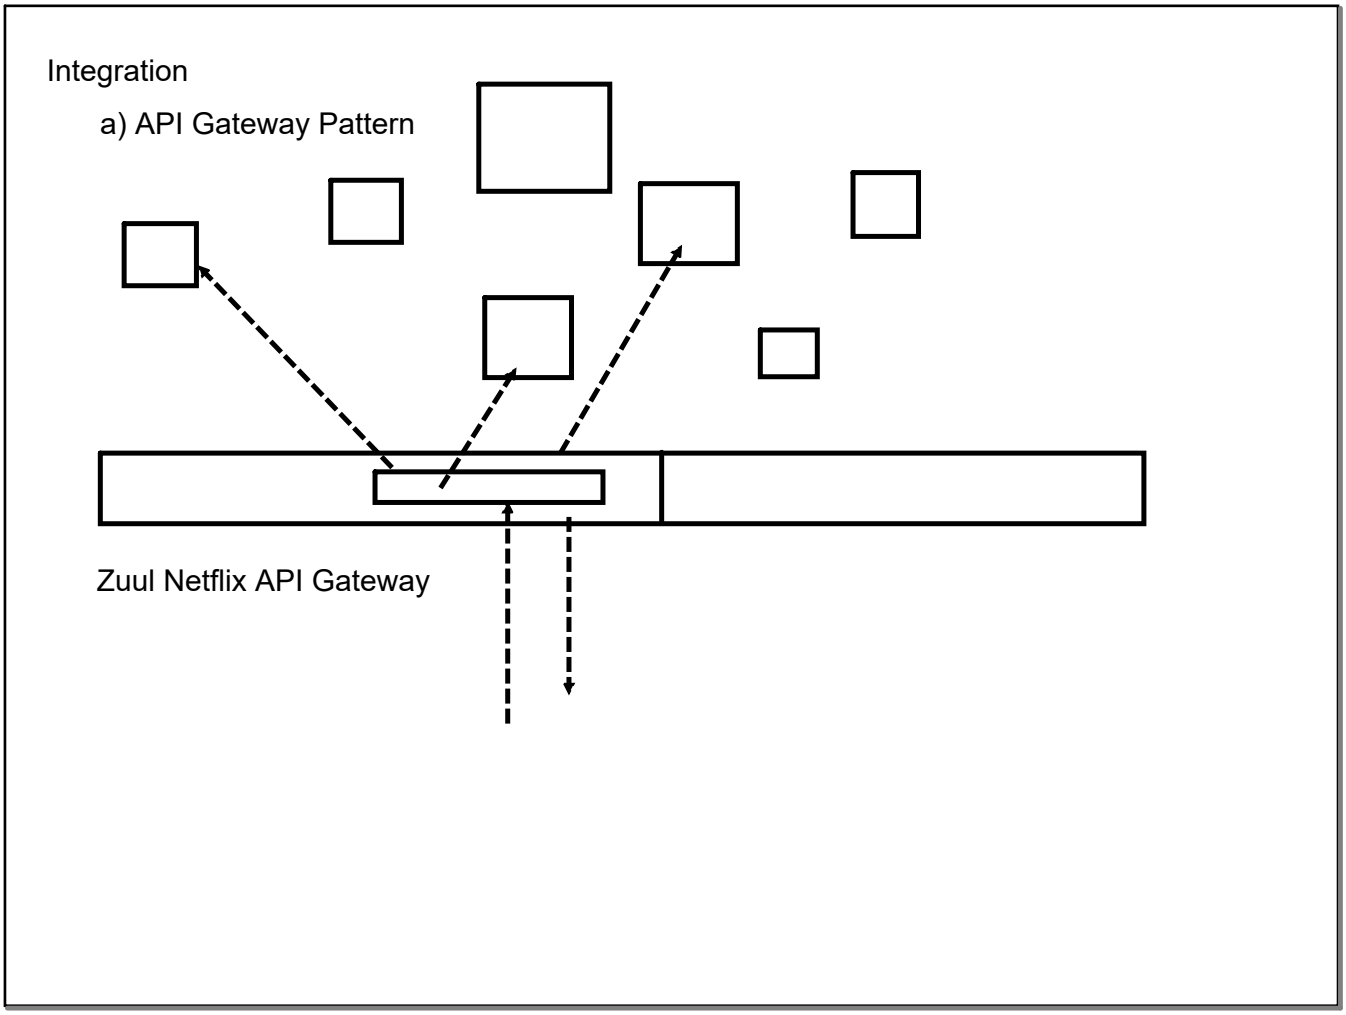
DDD : bounded context

sub-domains : BC with parent model

c) Strangler patterns

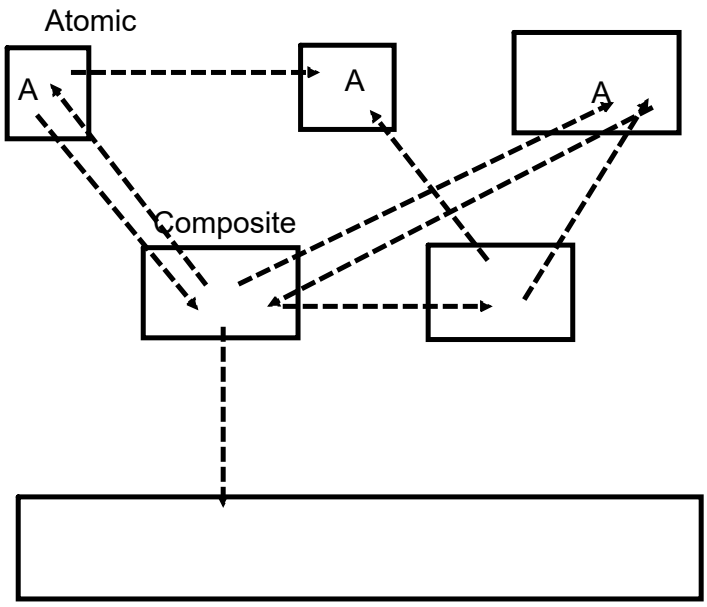
brownfield : converting monolith into MS

refactoring smaller req...



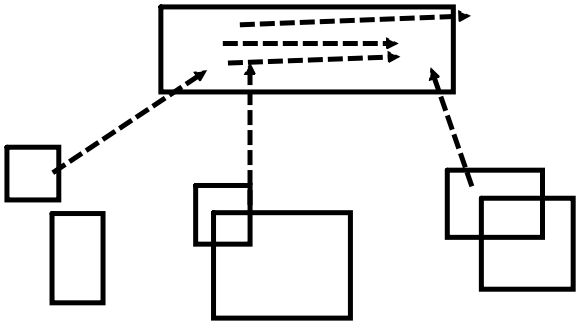
Integration
a) API Gateway Pattern
Zuul Netflix API Gateway

b) Aggregator Pattern



c) Client-side UI Composition

SPA : UI compositions



DataBase :

a) Ideal Pattern : Database Per Service

b) Shared Database :

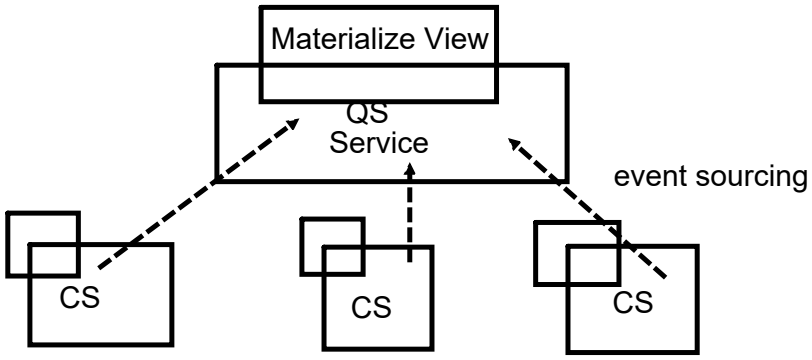
2-3 MS (DDD)

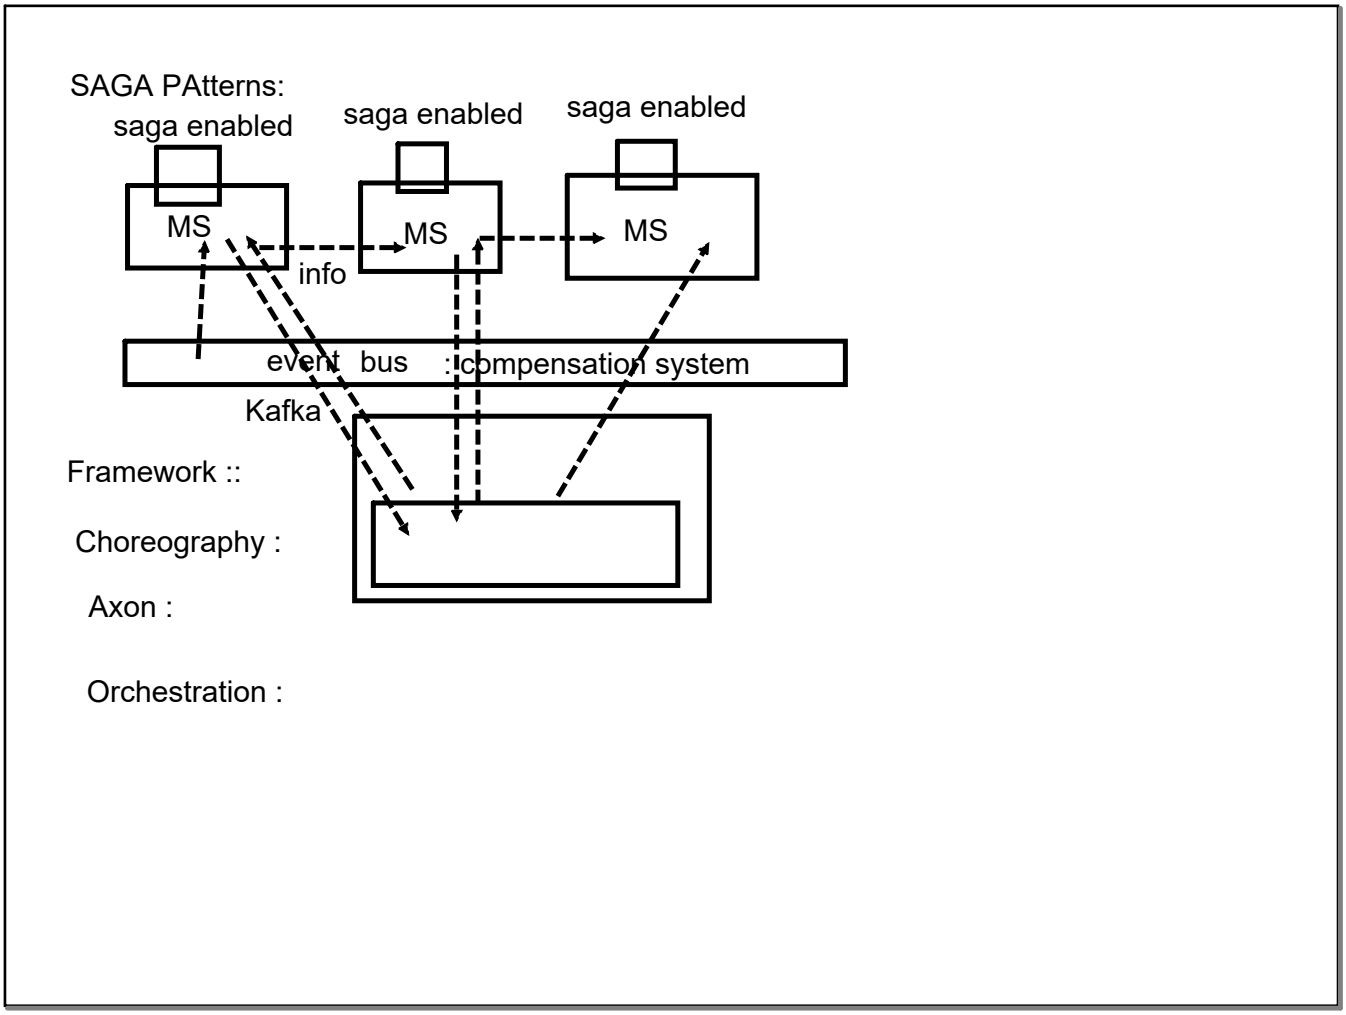
c) CQRS

Command Query Responsibility Segregation

Command Side (create/update/delete)

Query Side (retreive)





SAGA PAtterns:
saga enabled

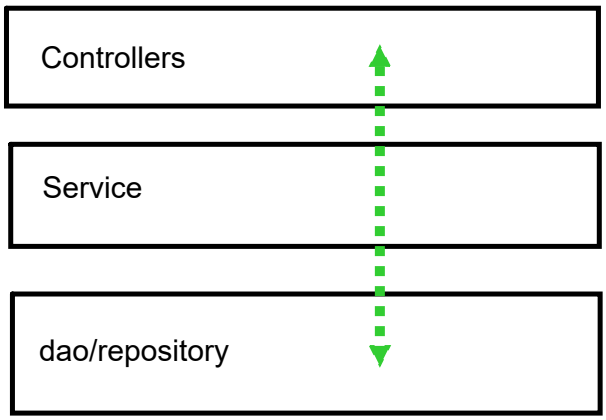
Spring Cloud :



Spring Data JPA

inbuilt repository (generic) with implementation

that can be customized/extend

CRUD

select * from <table-name>

=>table

=>datatype of primary key

entity : POJO <----> DB schema

DTO : POJO

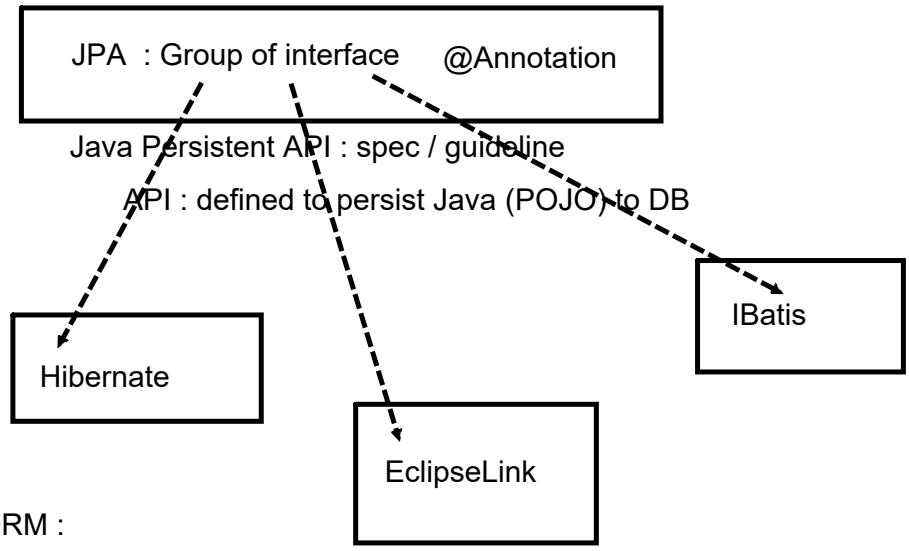
Validation

Exception

Need to configure properties file

for DB connection

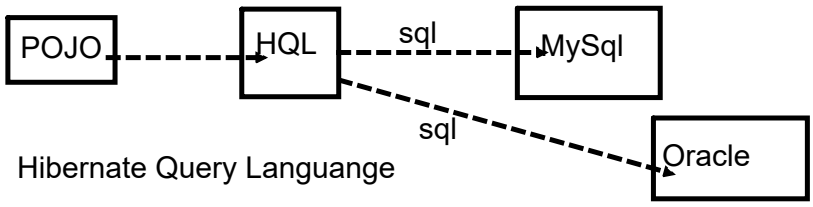
: MySql-Driver : dependency



ORM :

behind the scene

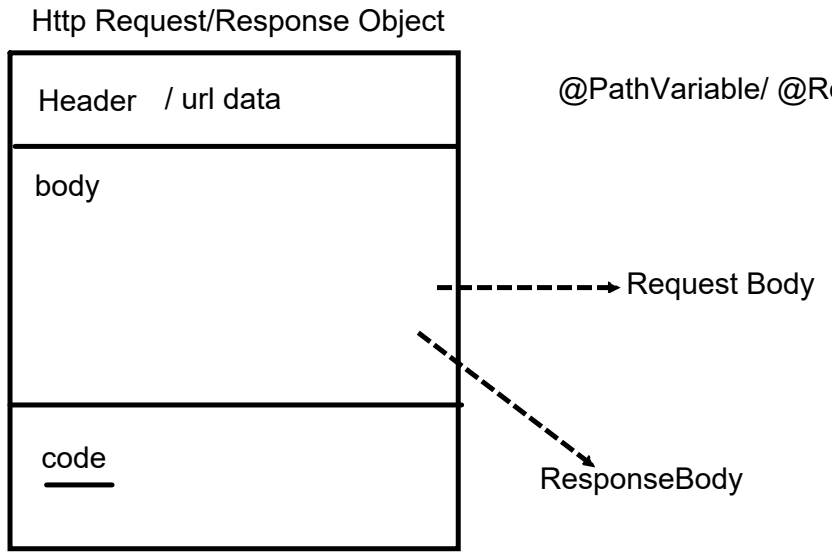
SQL queries would be created by Hibernate



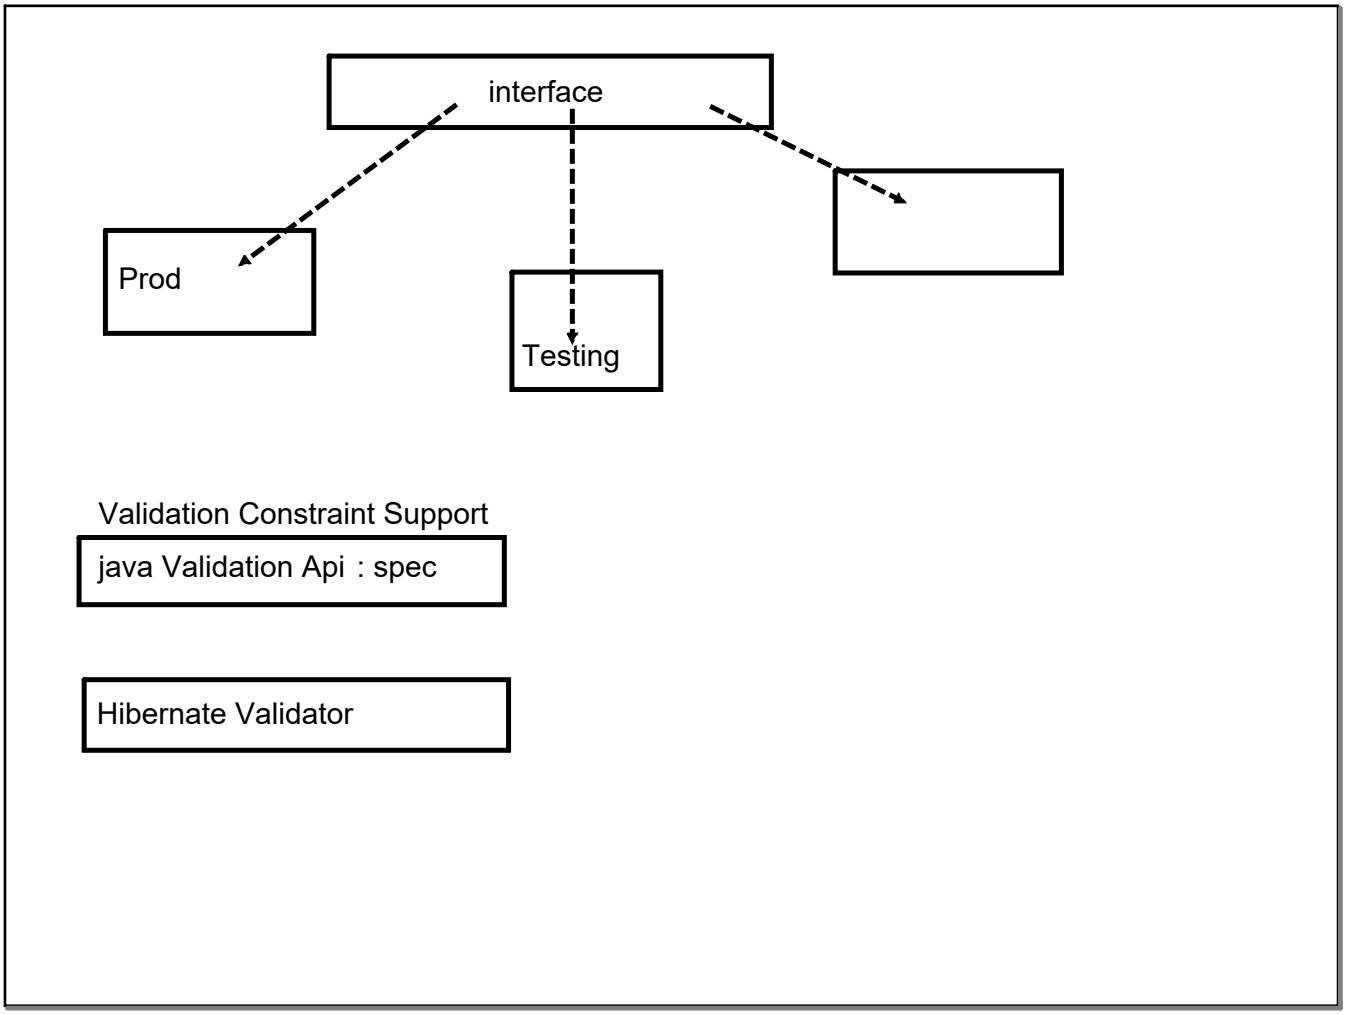
Hibernate Query Languange

Need to specify the dialect

c3p0 : dependency



All Rest Endpoints must have provision to customized the http Response object



interface
Prod
Testing
Validation Constraint Support
java Validation Api : spec
Hibernate Validator

Client Expecting : UserDetailDto (Success status)

Exception : UserExceptionDto (Failed status): throw an exception on client end of type mismatch

Server shall respond with appropriate status code

REst Client have provisions to check the status code

Adding a new data : instance/info about newly added data

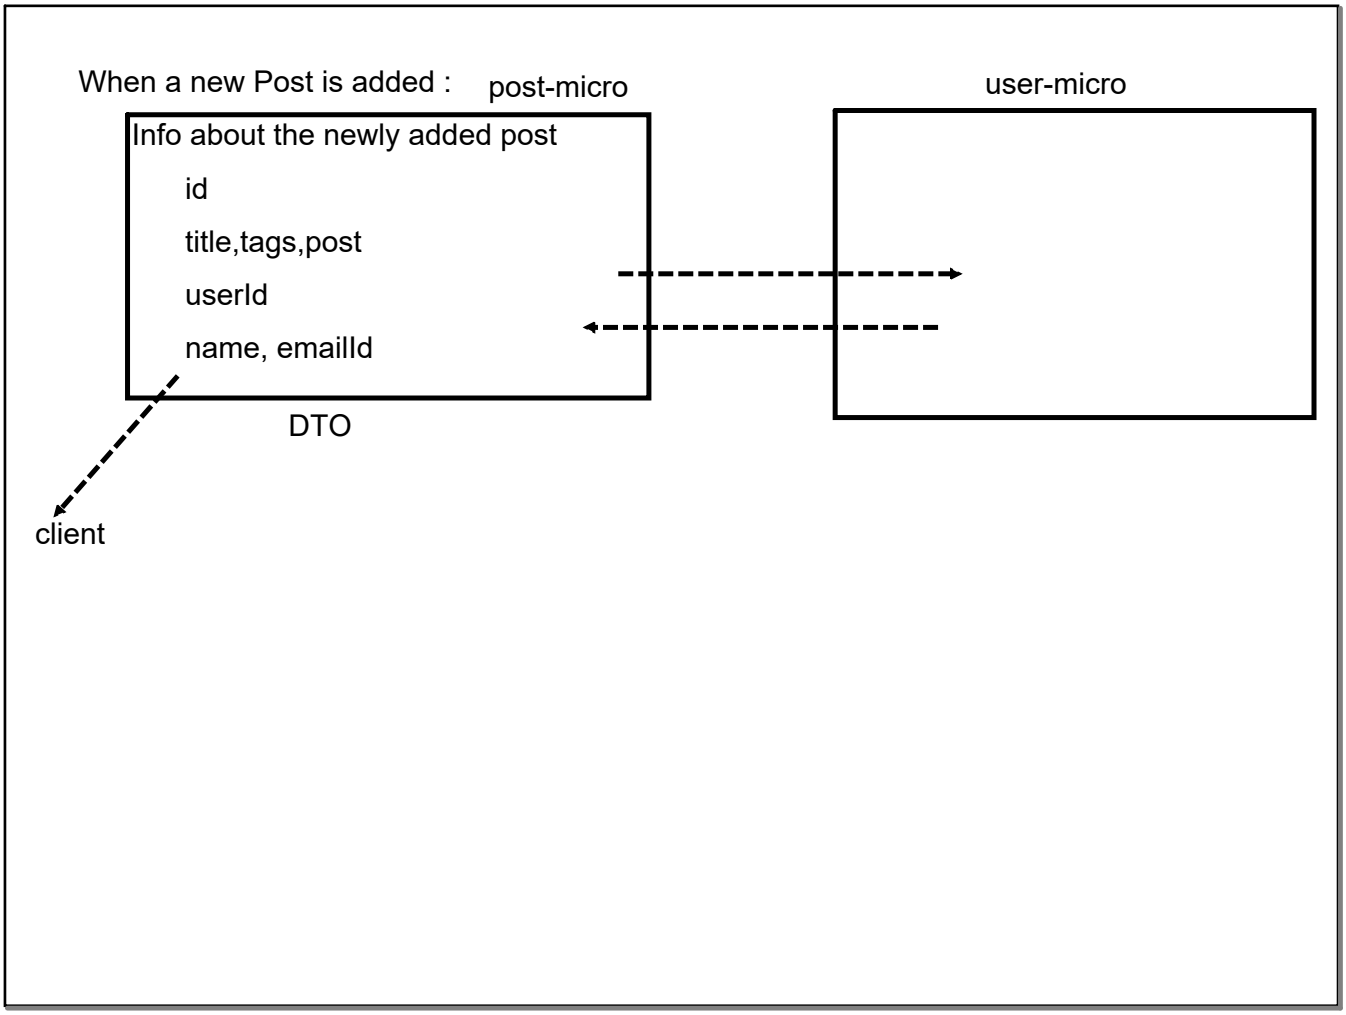
Updating the data : instance/info about update data

Deleting the record : instance/info about deleted data

DTO - entity DTO ->

4 + 3 ---> DB

Client : 7 fld (primary



When a new Post is added :
post-micro
user-micro
Info about the newly added post
id
title,tags,post

AS soon as we run MS,
they will start looking for DS (8761)
(Default)
9091
9092
names
Discovery Server/ Naming Server
register
Eureka (Netflix)
Spring boot + Eureka API

Two tables

1. User credential
2. Roles

User-Credentials
table ("users")
username : String
password : String
enabled : boolean

Roles
table ("authorities")
username : String
authority : String

password : encrypted form

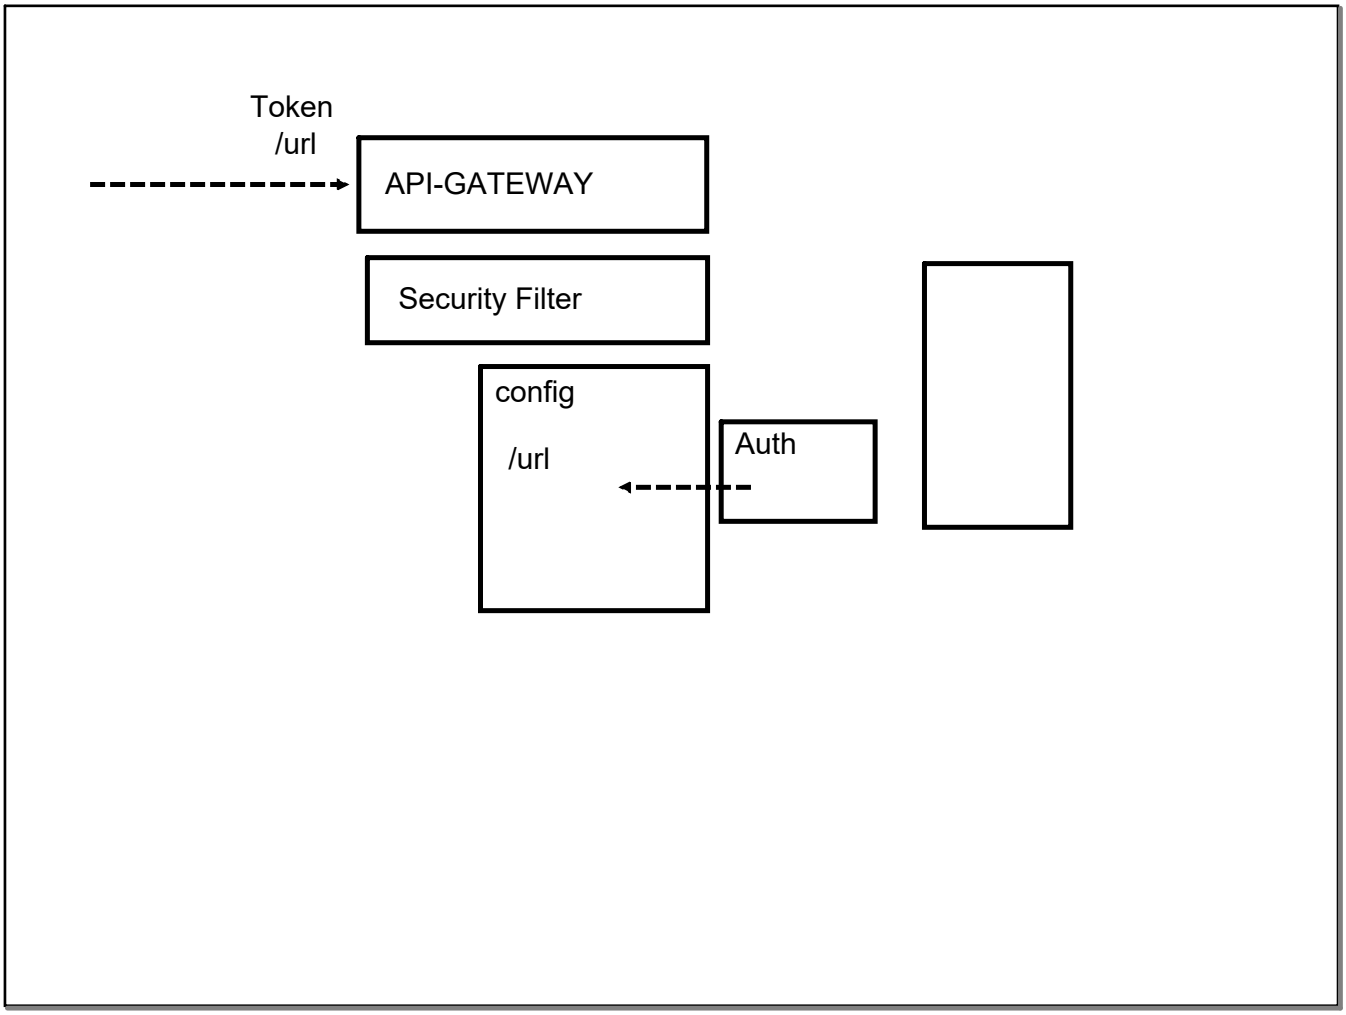
Spring security supports multiple encryption

eg:

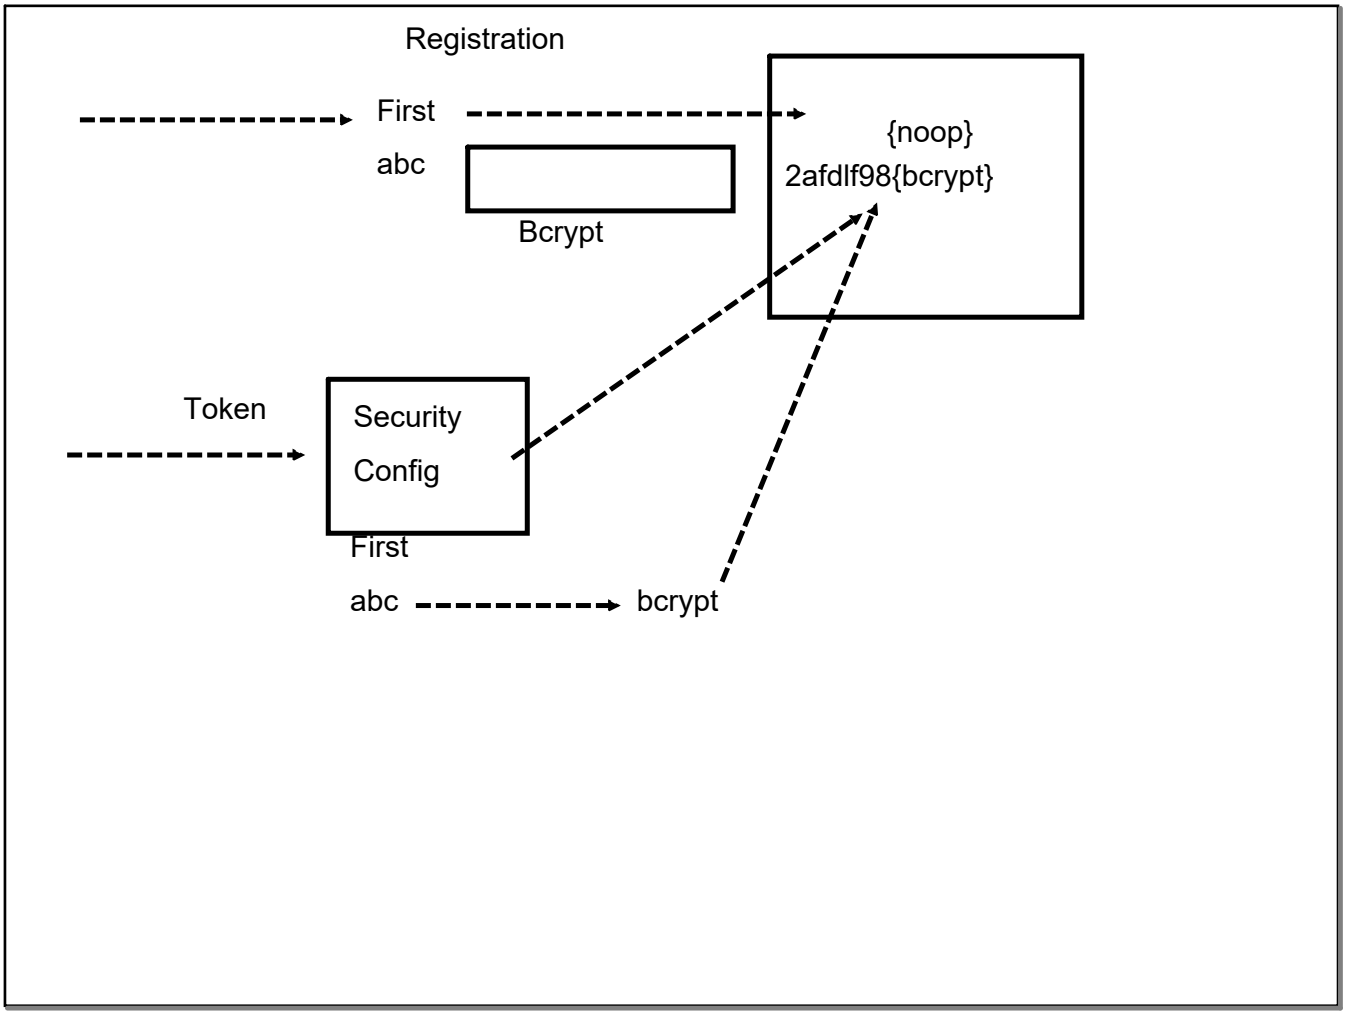
Plain-Text
abc{noop}

Bcrypt (one way)
{bcrypt}2afdhfldron98

Roles:
Manager ~ Role_Manager



Token
/url
API-GATEWAY
Security Filter
config
/url
Auth



Registration
First
abc
Bcrypt
{noop}
2afdlf98{bcrypt}

First
abc
bcrypt

3 core elements

HTML : Structure

CSS : Presentation

JavaScript : Behavior

HTML-5

Validations

Drag n Drop

Semantic Tags

Web Workers

Offline functionlity

Geolocation

New Semantic Tag (Backward Compatible)

purpose full (specific to req)

=> container

=> attributes -- Form based extention

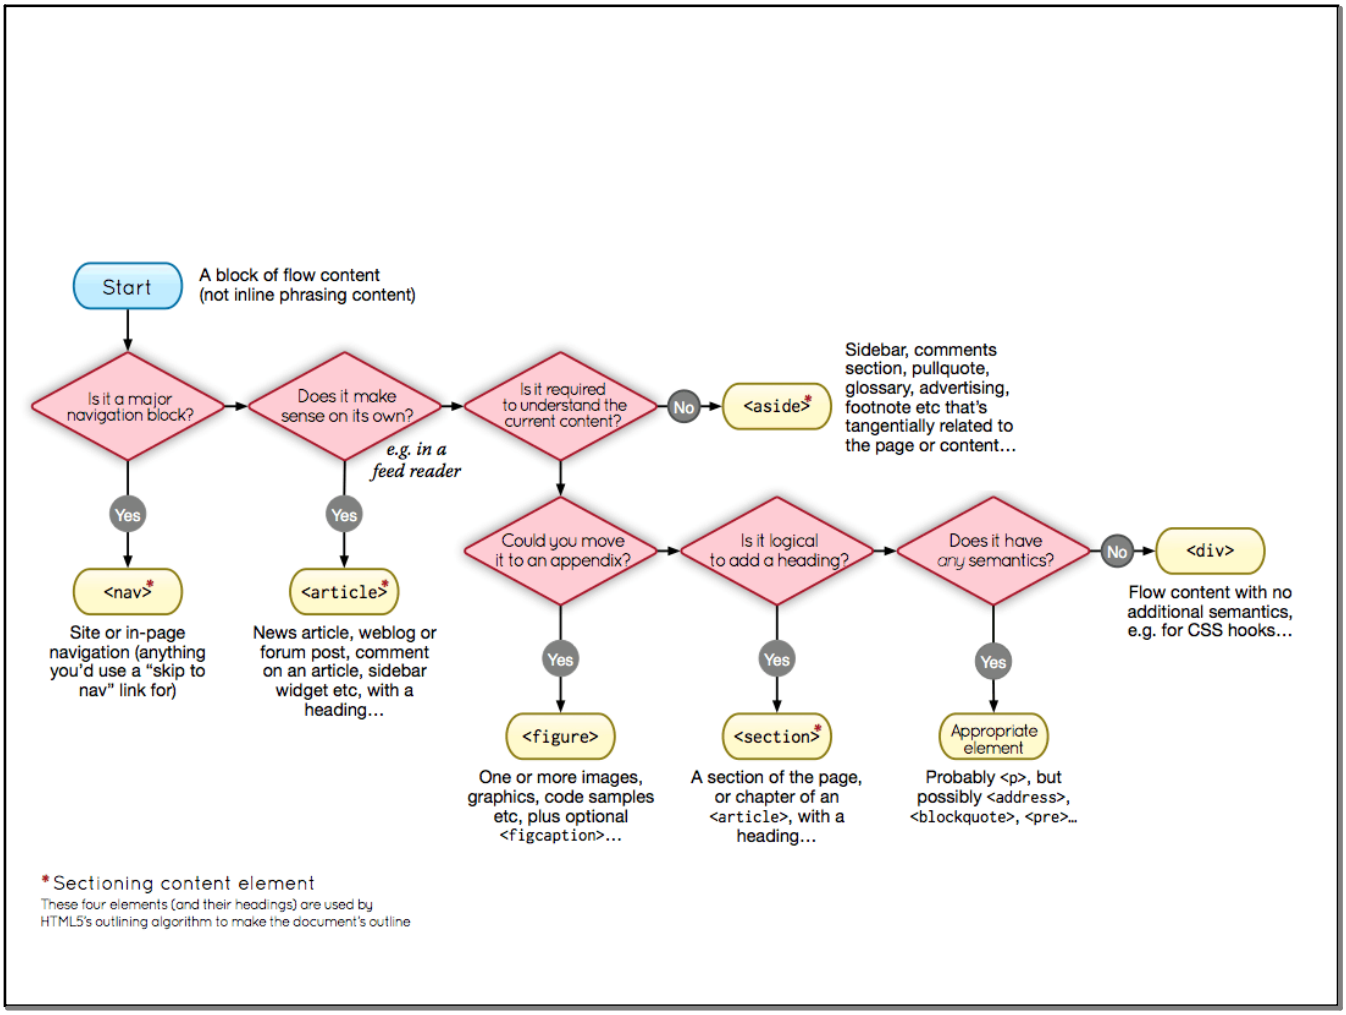
Smooth Renderring (outline algo)

more compatible to search algo

in sync with Assisstive Tech

Standardized Error handling algo : Developers (Debug)
images/audio/videos : third party plugins : HTML5 tags + API (control)
Built-in APIs

traditional:
    <p>, ,
article
section
aside
header
footer



Start
A block of flow content (not inline phrasing content)
Is it a major navigation block?
Yes
<nav>*
Site or in-page navigation (anything you'd use a "skip to nav" link for)
Does it make sense on its own?
e.g. in a feed reader
Yes
<article>*
News article, weblog or forum post, comment on an article, sidebar widget etc, with a heading…
Is it required to understand the current content?
No
<aside>*
Sidebar, comments section, pullquote, glossary, advertising, footnote etc that's tangentially related to the page or content…
Could you move it to an appendix?
Yes
<figure>
One or more images, graphics, code samples etc, plus optional <figcaption>…
Is it logical to add a heading?
Yes
<section>*
A section of the page, or chapter of an <article>, with a heading…
Does it have any semantics?
Yes
Appropriate element
Probably <p>, but possibly <address>, <blockquote>, <pre>…
No

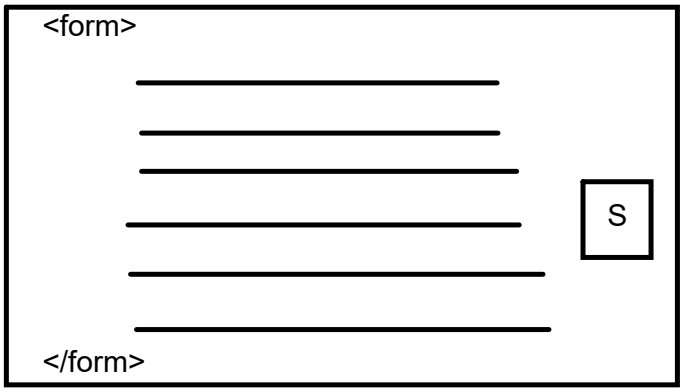
Flow content with no additional semantics, e.g. for CSS hooks…
*Sectioning content element
These four elements (and their headings) are used by HTML5's outlining algorithm to make the document's outline

Html form :

specialized form inputs

validation : required/pattern

special att : custom behavior of form



Canvas API

DOM Tree managed by the browser

Html component(Tag) : JS - object

User Interaction : presentation : CSS

Cascade style sheet

Stylesheet : : set of rules 'presented'

Cascade : set of rules : resolve the conflict of multiple ss applied on a element

Specificity

controlling over where to apply the style

CSS rule :

CSS Selector

CSS declaration

```
selector {
    property : value
}
```

selector : css rule would be applied to which HTML elem

Selector

Type (most varied : wide spectrum : which type HTML element)

ID

class

eg :

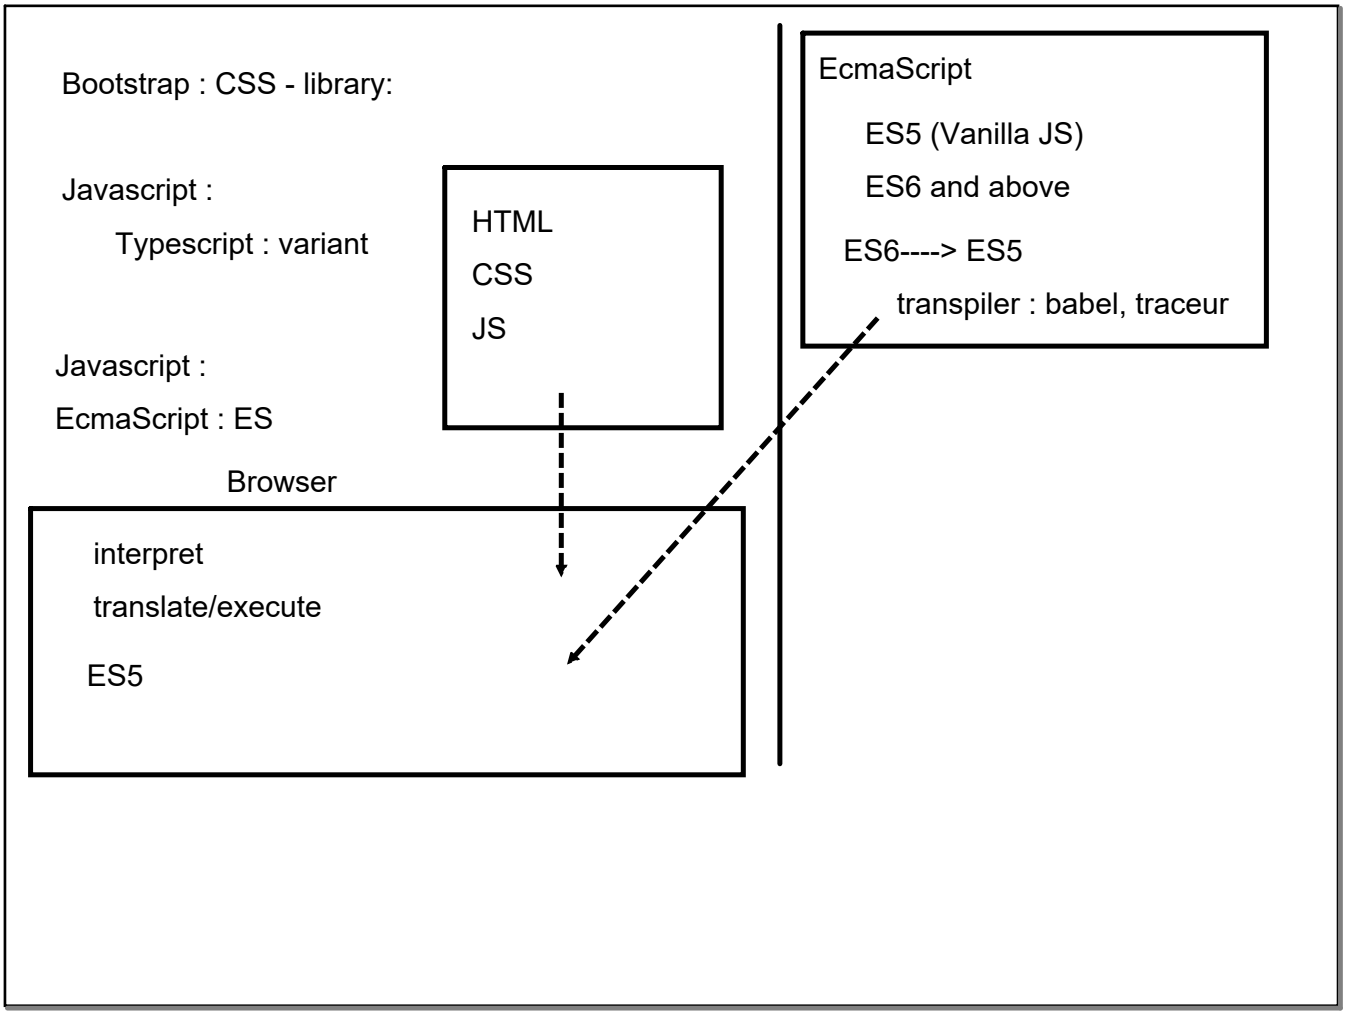
```
p{
    ----------
    ----------
}
```

ID : very specific

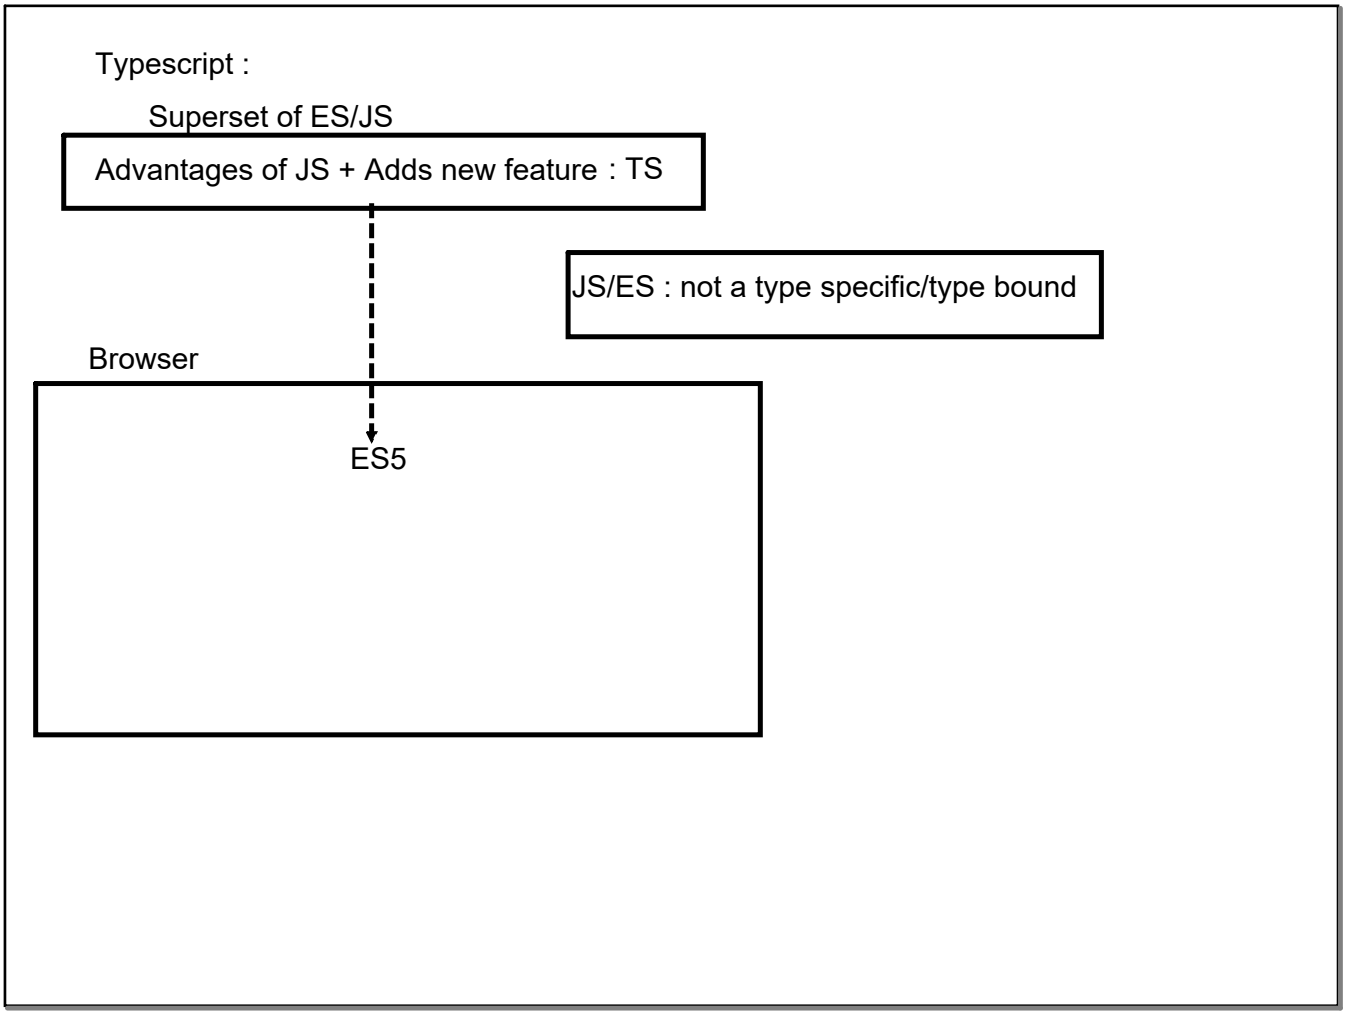
```
#canvastest{
    ------------------------
    ------------------------
}
```

class

```
    .mclass{
        -----------------
        ------------------
    }
```



Bootstrap : CSS - library:
Javascript :
Typescript : variant
Javascript :
EcmaScript : ES
HTML
CSS
JS
Browser
interpret
translate/execute
ES5
EcmaScript
ES5 (Vanilla JS)
ES6 and above
ES6----> ES5
transpiler : babel, traceur



Typescript :
Superset of ES/JS
Advantages of JS + Adds new feature : TS
JS/ES : not a type specific/type bound
Browser
ES5

Javascript

```
function add(num1, num2){
  // validation check
   return num1 + num2;
}
```

call : add(20, 30); // arithmatic addition

: add('hello', 'world'); // string concatenation

Unwanted behavior at runtime

Typescript :

- Named Types...
- NextGen JS features
- NonJS features like Interface/Generics
- Decorators (Meta-Programming)
- More Config options

Transpiler : Typescript compiler

Javascript based resource, managed way

management tool :

- nodejs : npm : node package manager
- yarn

NodeJs : installed + system path

(npm) : cli

NodeJs : Framework that allows to use JS for server side programming: non-blocking, asynchronous server implementation

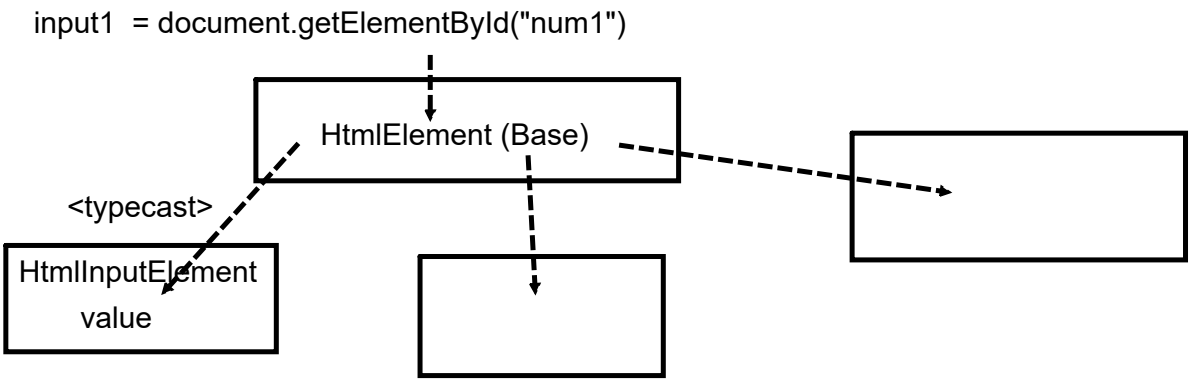
npm : is a project management tool for JS related project management

```
# Need to install typescript compiler
>npm install -g <tool> (global installation)
> npm install -g typescript
```

Typescript file must have ext : .ts

<variable name> : <typename>

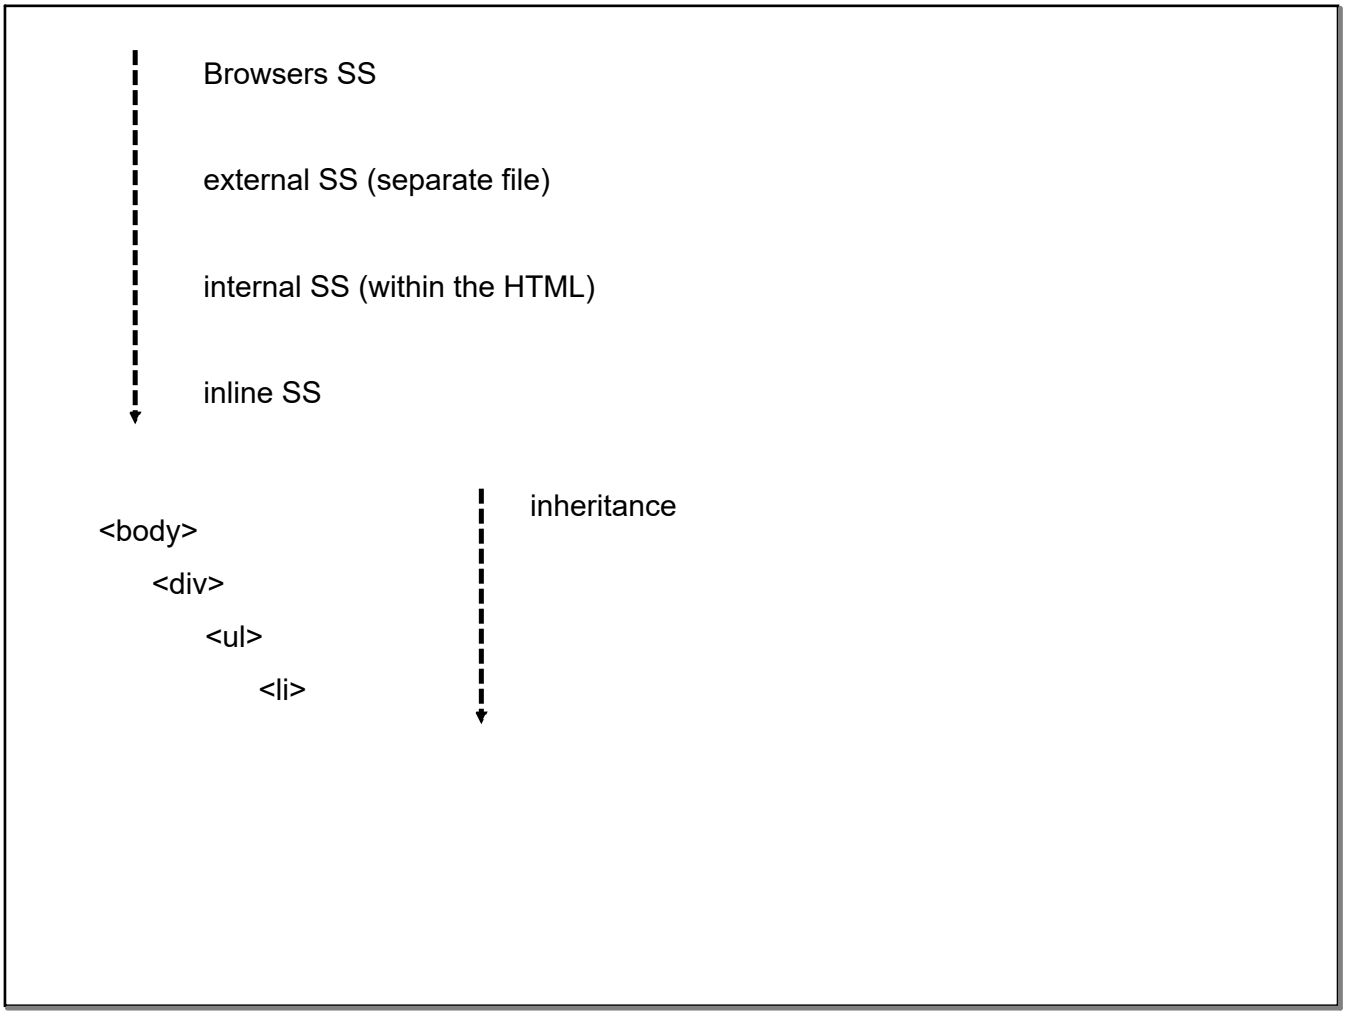
Every HTML Components has a specific JS class



var ~ ES6 : const / let

Core Types

- number : integer/fractions
- string : 'hello', "hello", `hello`
- boolean : true,false
- object : Javascript object (more type specific)Object Notation
- Array : JS has way to create array of heterogenous nature (TS : homogenous)
- Tuple : Fixed length : Type
- # Union : specify multiple types
- Enum : enumerated Datatype
- any : default JS type



Browsers SS
external SS (separate file)
internal SS (within the HTML)
inline SS
inheritance
<body>

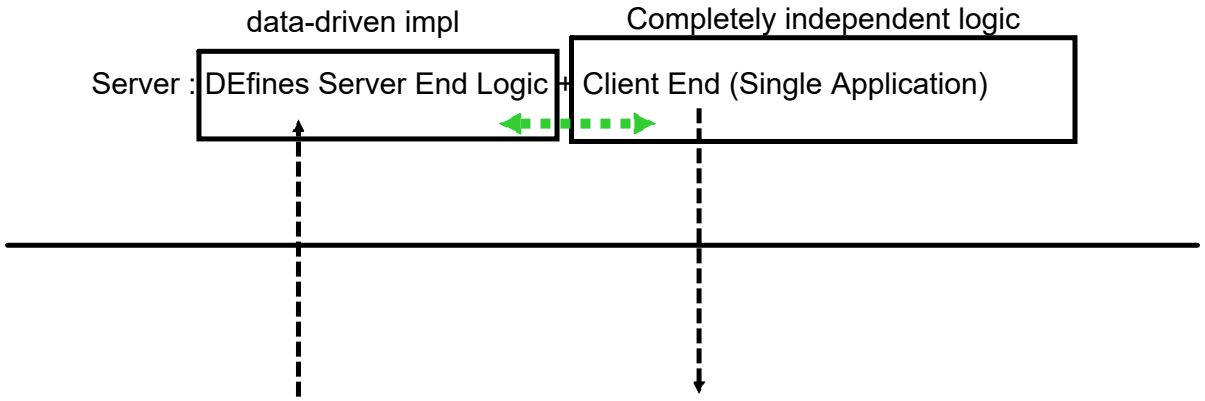
Classes : high level way :

Closures :

have global variable(memory retains across function calls) with local scope

static variables of C functions

Angular : FrontEnd Framework



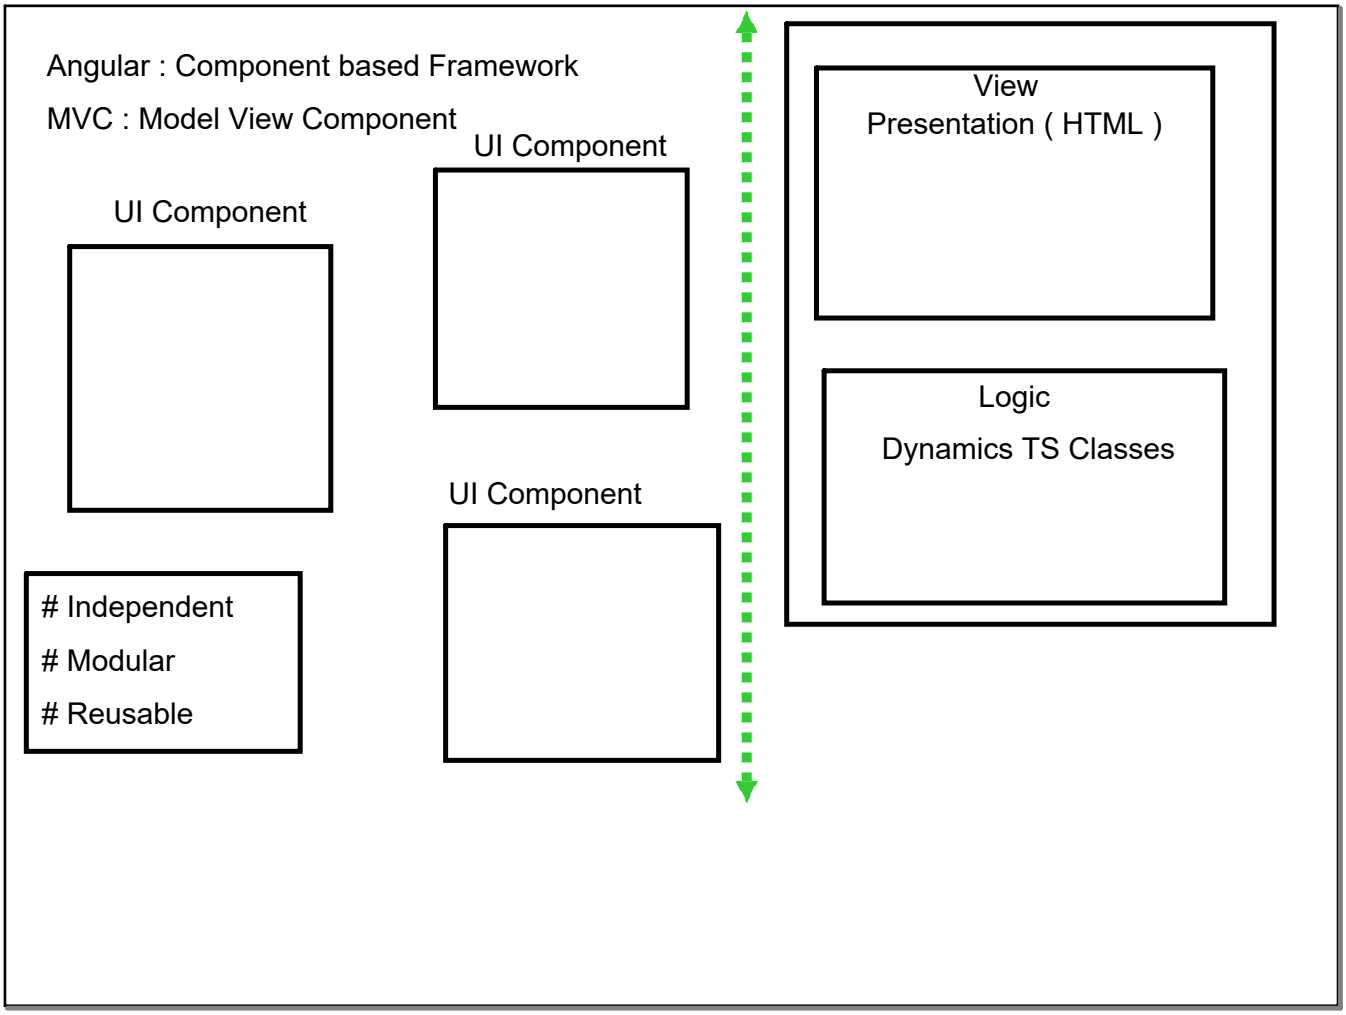
Loose coupling of Server Side (backend logic) and Client Side (Frontend logic)

1. Server Side is reusable
2. Client Side is also reusable (flexible)
3. More independent implementation
4. Load Distribution among client machine (renderring the dynamic web-pages : JS)
5. Client End Renderring can Highly customized

Angular Framework

Complete Framework

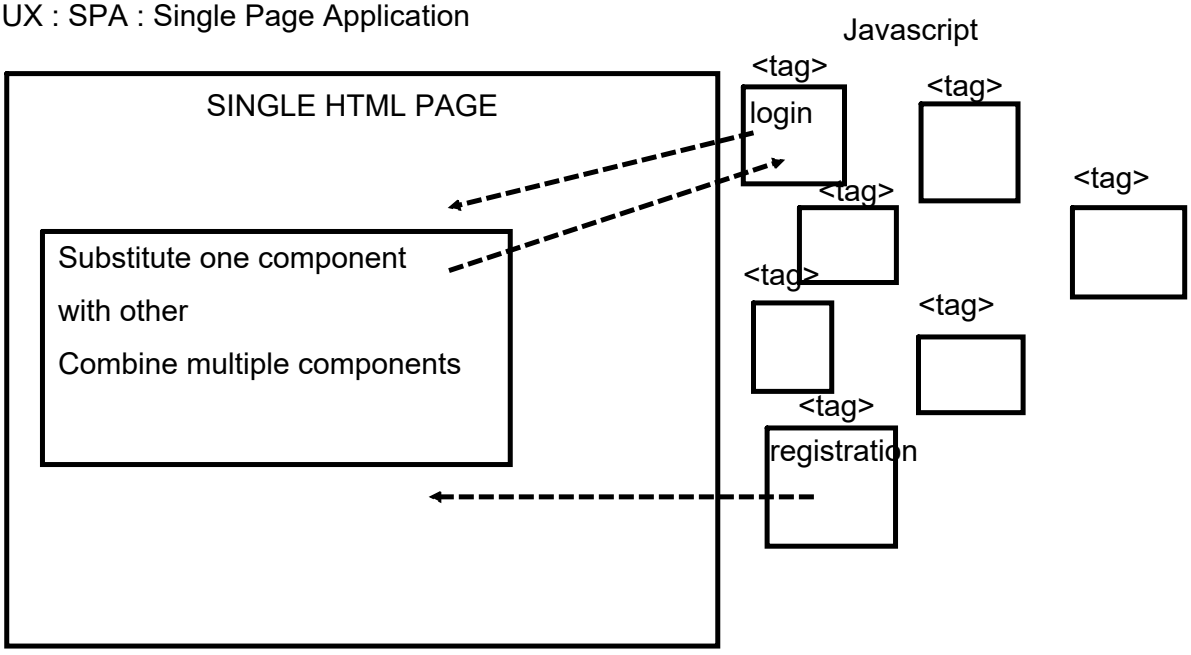
Base Script : TS
Resources : Client Side JS Community Library
npm to manage angular application



Angular : Component based Framework
MVC : Model View Component
UI Component
UI Component
UI Component
Independent
Modular
Reusable
View
Presentation (HTML)
Logic
Dynamics TS Classes

Relationship : (logic + presentation) decide the output

UX : SPA : Single Page Application



Angular/CLI Project needs to be installed

Download angular CLI/installed

(by default latest version)

> npm install -g @angular/cli

Angular CLI will expose angular specific command

> ng <option> (syntax)

> ng new <project-name>

1. Complete folder/file structure required as Angular Framework project

2. Download default Angular lib

> Add routing module (Y)

> Stylesheet : CSS(default)

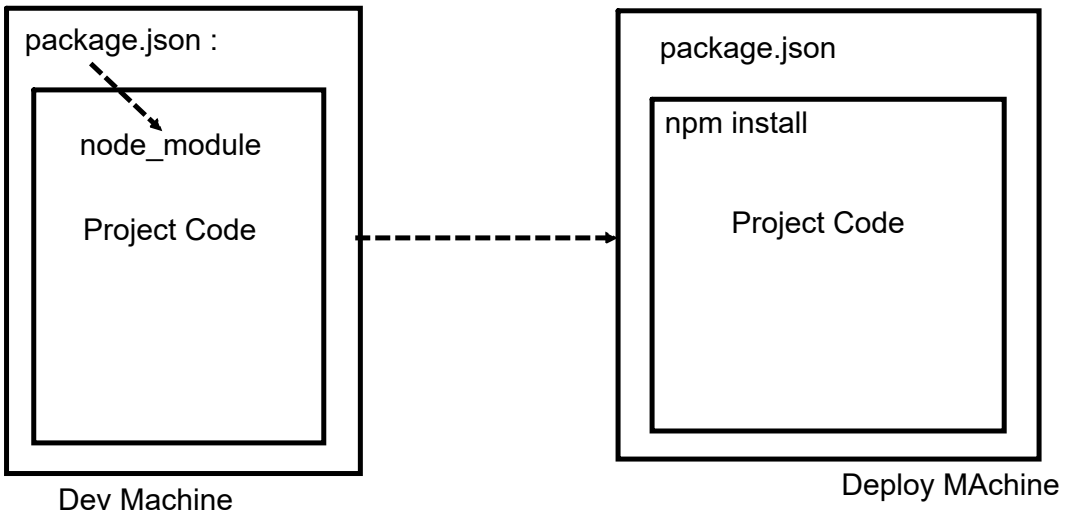
Feature Set for Unit/Integration Testing and End-To-End Testing

1. Jasmine Framework : JS Testing Framework (Write Test case unit/integration + e2e)
2. Test Runner : Unit Test (Karma)
3. Test Runnner/Framework : End-To-End Testing (Protractor)

e2e : supposed to contain test cases/config related to End-To-End Testing

node_module : All lib are stored in this folder

src : All Angular code goes here



package.json is default dependency file for all

JS based application

> npm install (--dev) command will by default read package.json

and download all dependencies auto and store in node_modules (Default folder for all JS app)

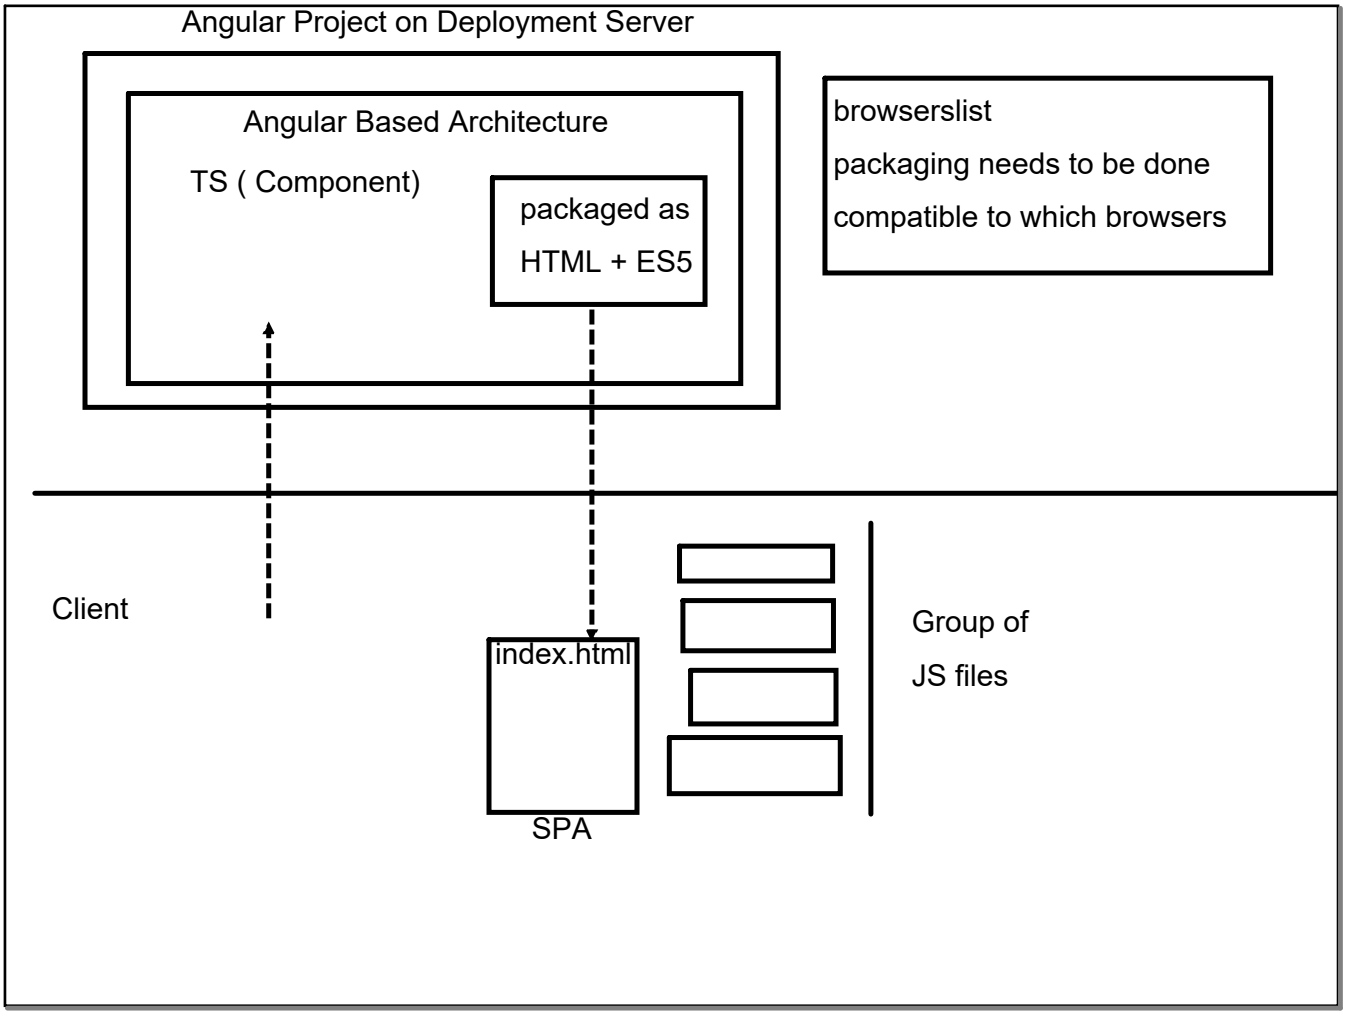
Adding a new Dependency:

1. add an entry in package.json
2. npm install (download the dependency and add it to node_module)

1. npm install -g <lib-name> (install library globally in my system)

~ npm install --save --dev <lib-name>

1. add a entry in package.json(update)
2. down load dependency and save it in node_module



Angular Project on Deployment Server

Angular Code Construct
Module(Root)
class
Module (Root)
Root Component
Sub Components
Sub Component
Sub Module

By Default:

- Single Module (represented as TS class) : allow to put/share common config/resources for all components under it (app)
  - Single Component
- Routing Module (Exclusively for Routing)/ only if asked to create
  - child routing (can be added later on)

import

import <class name> from <library>

import {<class name1>,<class name2>} from <library>

Component :

TS class : supported by presentation (View)

By default :

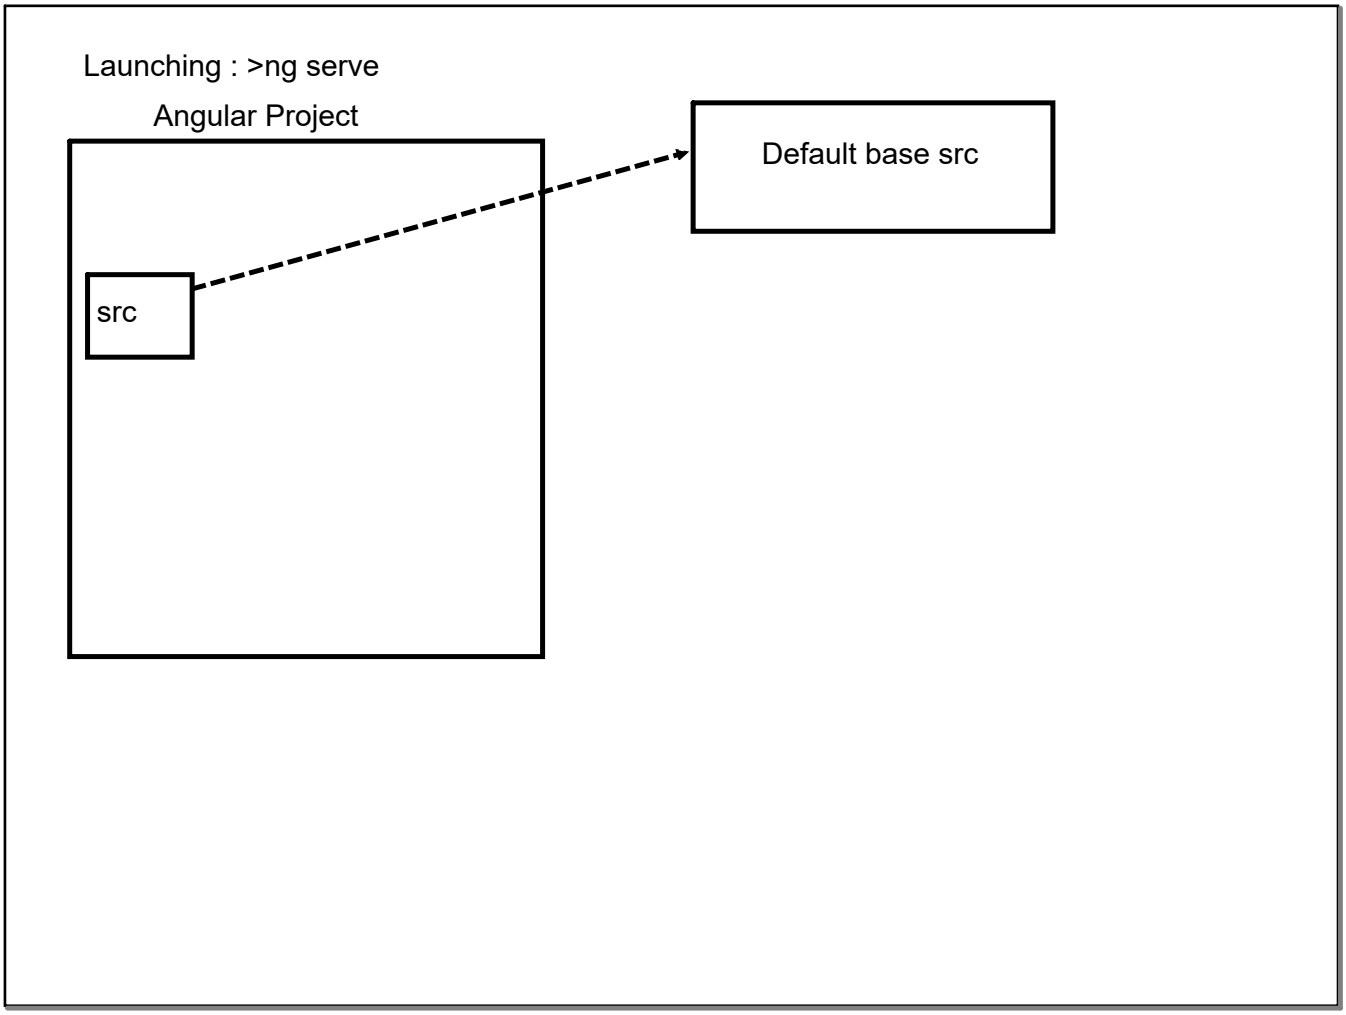
Angular : 4 files for each component

TS class (mandatory)

HTML file (View)

CSS (contain exclusive classes for that component)

Test : unit test code for that component



Launching : >ng serve
Angular Project
Default base src
src

Creating a new component

> ng generate component <comp-name>

class data (public)
department
directly accessible
in HTML
Interpolation
{{department}}

Angular : Directives (Dynamic in HTML)

HTML

HTML features Extended by directive

<new tags>

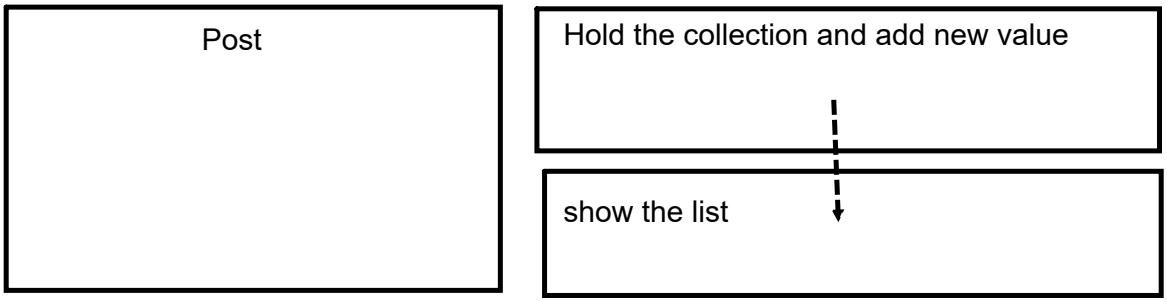
< new attributes> along with existing HTML attributes, new attributes are provided by Angular Directives

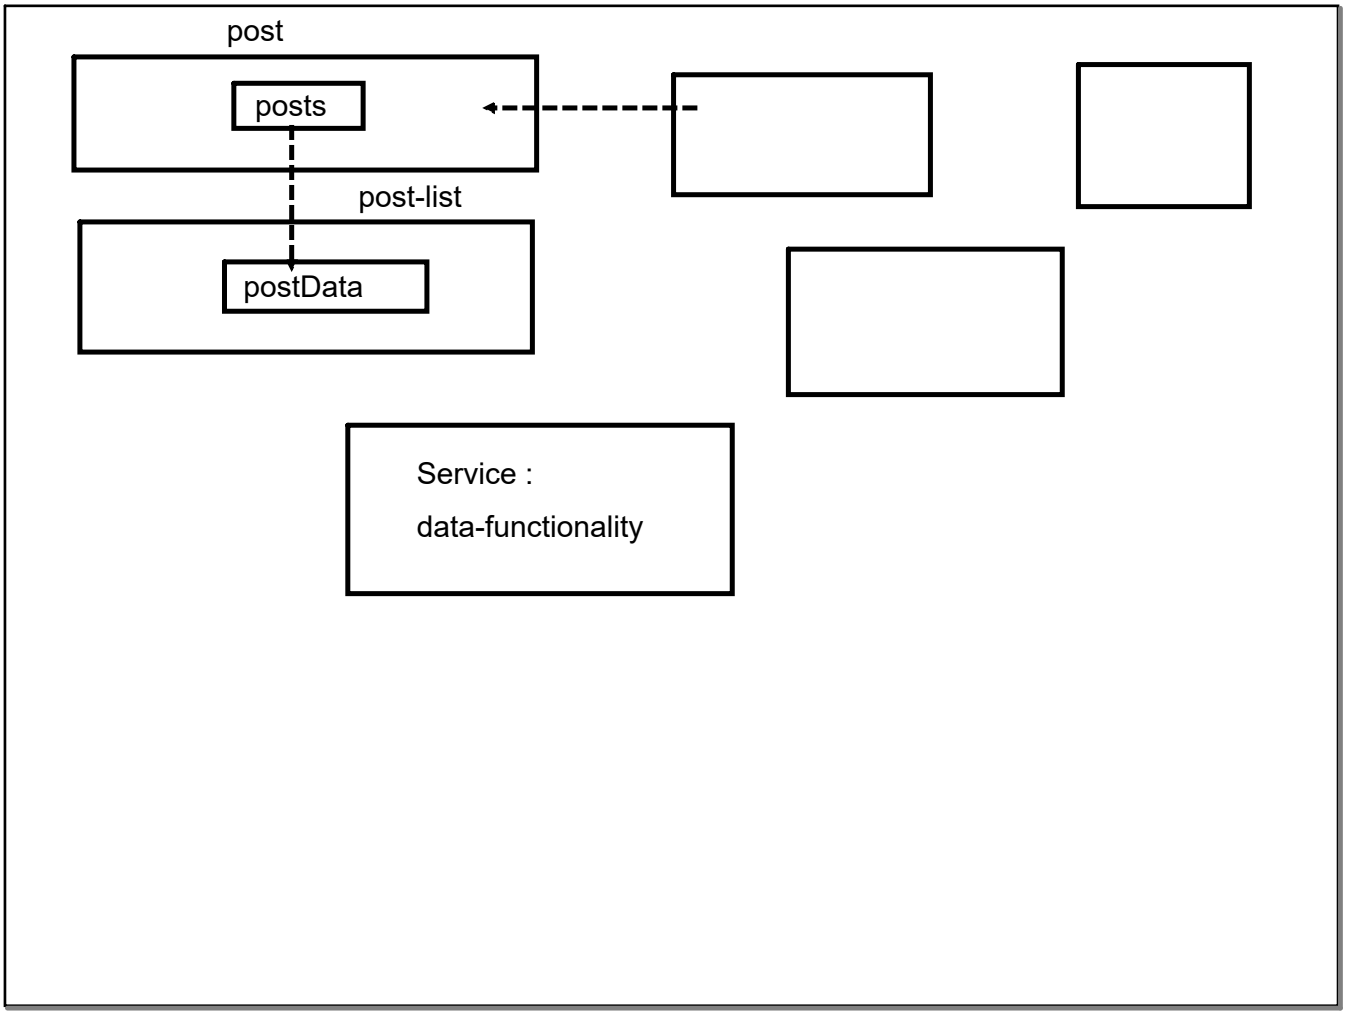
eg : for loop directive

Angular allows to associate a variable with HTML elements

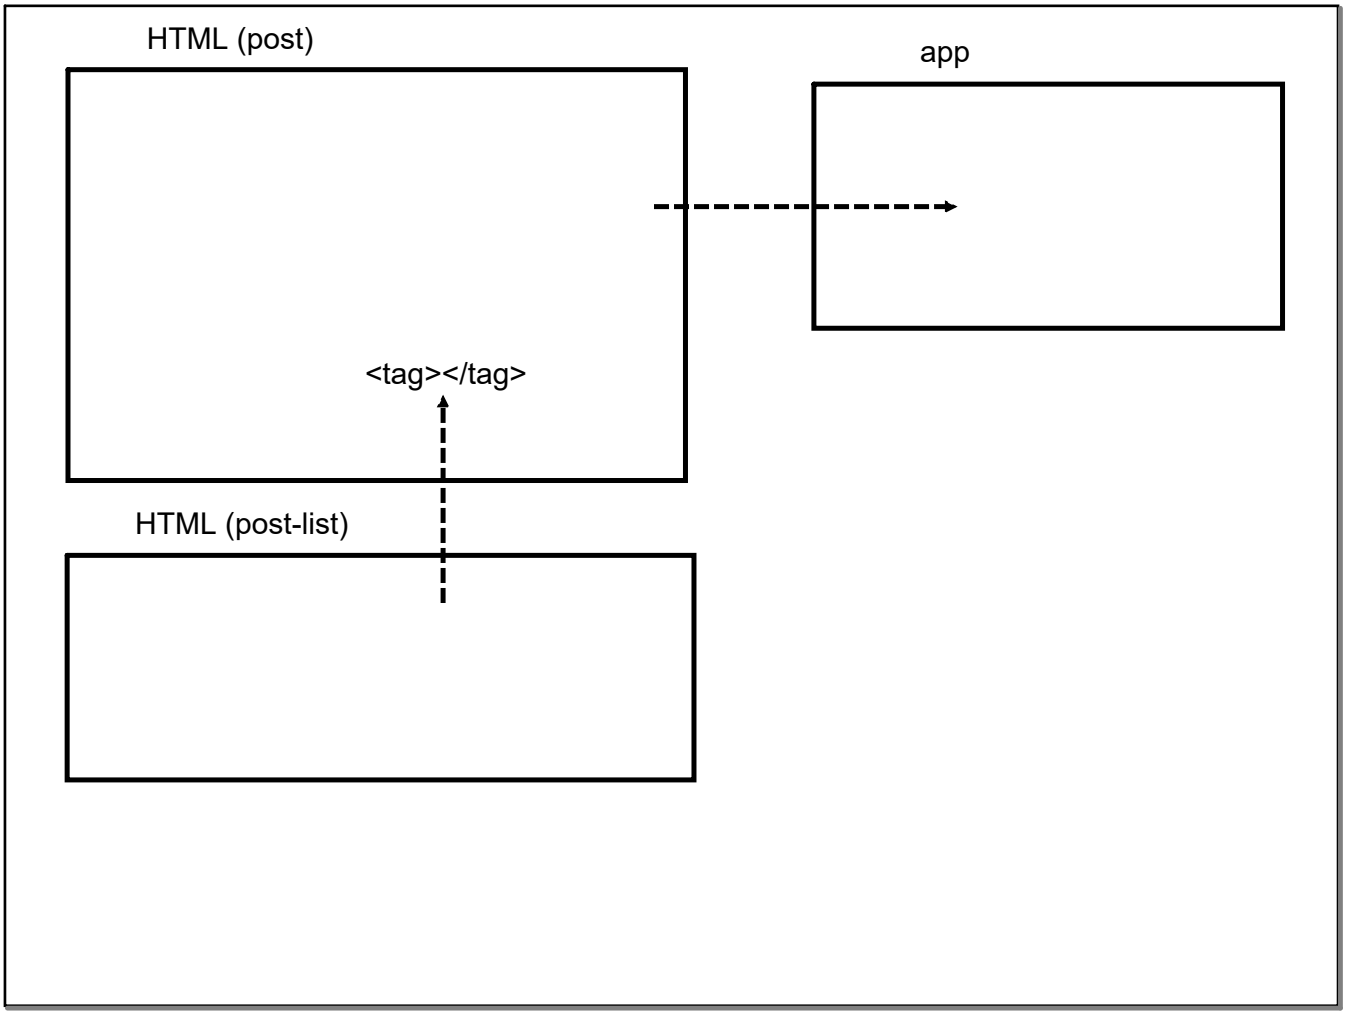
var txtTitle: HTLMInputElement = document.getElementById("")! as HTMLInputElement;

Angular : Synthetic events : allows to call TS class methods on events

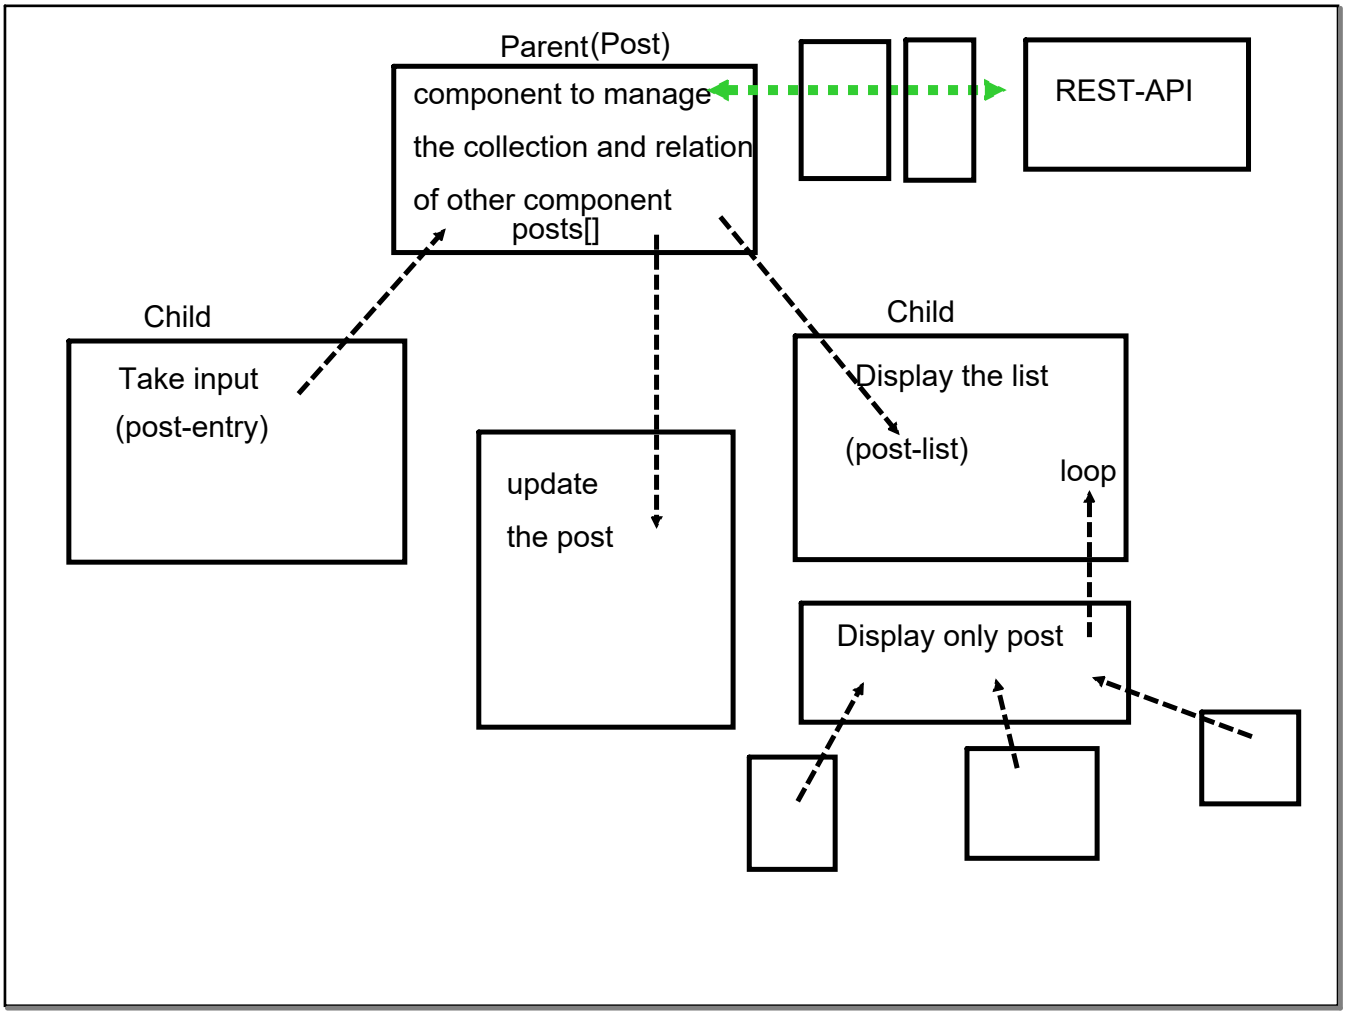




post
posts
post-list
postData
Service :
data-functionality

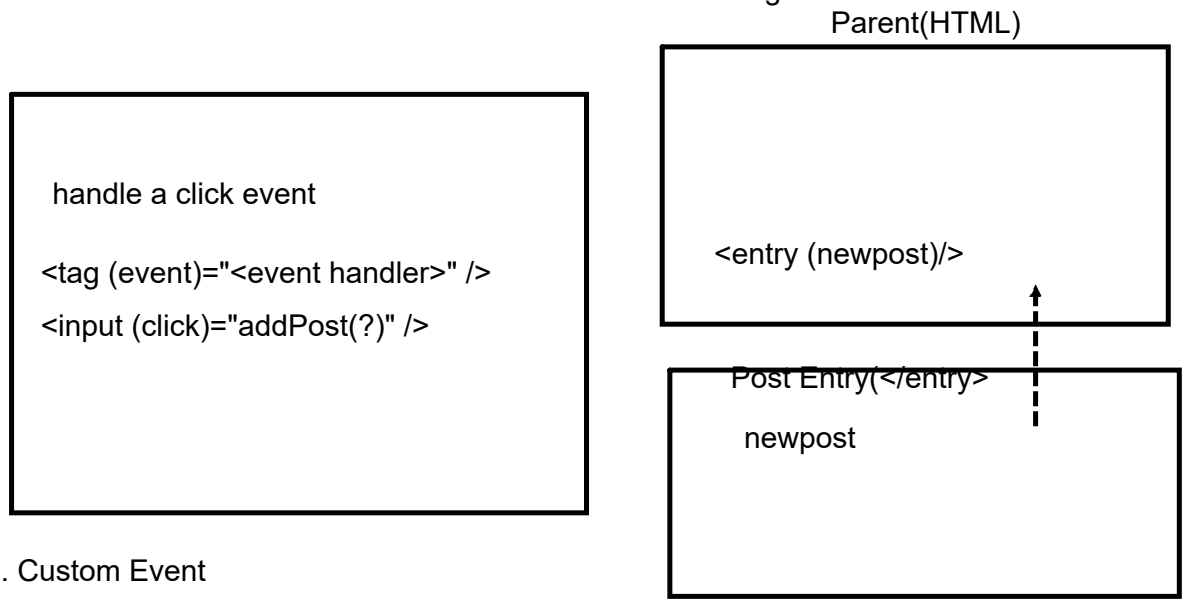


HTML (post)
app
<tag></tag>
HTML (post-list)



Parent(Post)
component to manage
the collection and relation
of other component
posts[]
REST-API
Child
Take input
(post-entry)
update
the post
Child
Display the list
(post-list)
loop
Display only post

1. Delegated Entry UI to entry component
2. Add button event handler code also needed to be delegated



1. Custom Event
2. Programmatically emit an event + send some data to event handler of another component

Directives :

*ngIf : Controls the visibility of any component

*ngIf="<condition>"

true : Component is visible

false : not visible

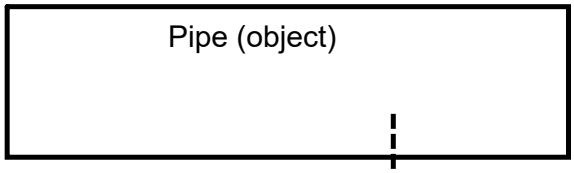
Pipes : transform the data for presentation purpose

pipe : |

TS class represents a Pipe

Test File

Function : pure/impure



<h2>FileSize : {{fileSize | size }} </h2>

<h2>FileSize : {{bandwidth | size }} </h2>

singleton / prototype

pure : every time you pass same input, same output will be received : shared

impure : internal state of function will decide can't be shared

Pipe : is pure : singleton

: impure : prototype

Handling Form in Angular

Good Library support

inbuilt modules :

1. FormsModule
2. ReactiveFormsModule

Two Different Way :

1. Template
2. Model (Reactive)

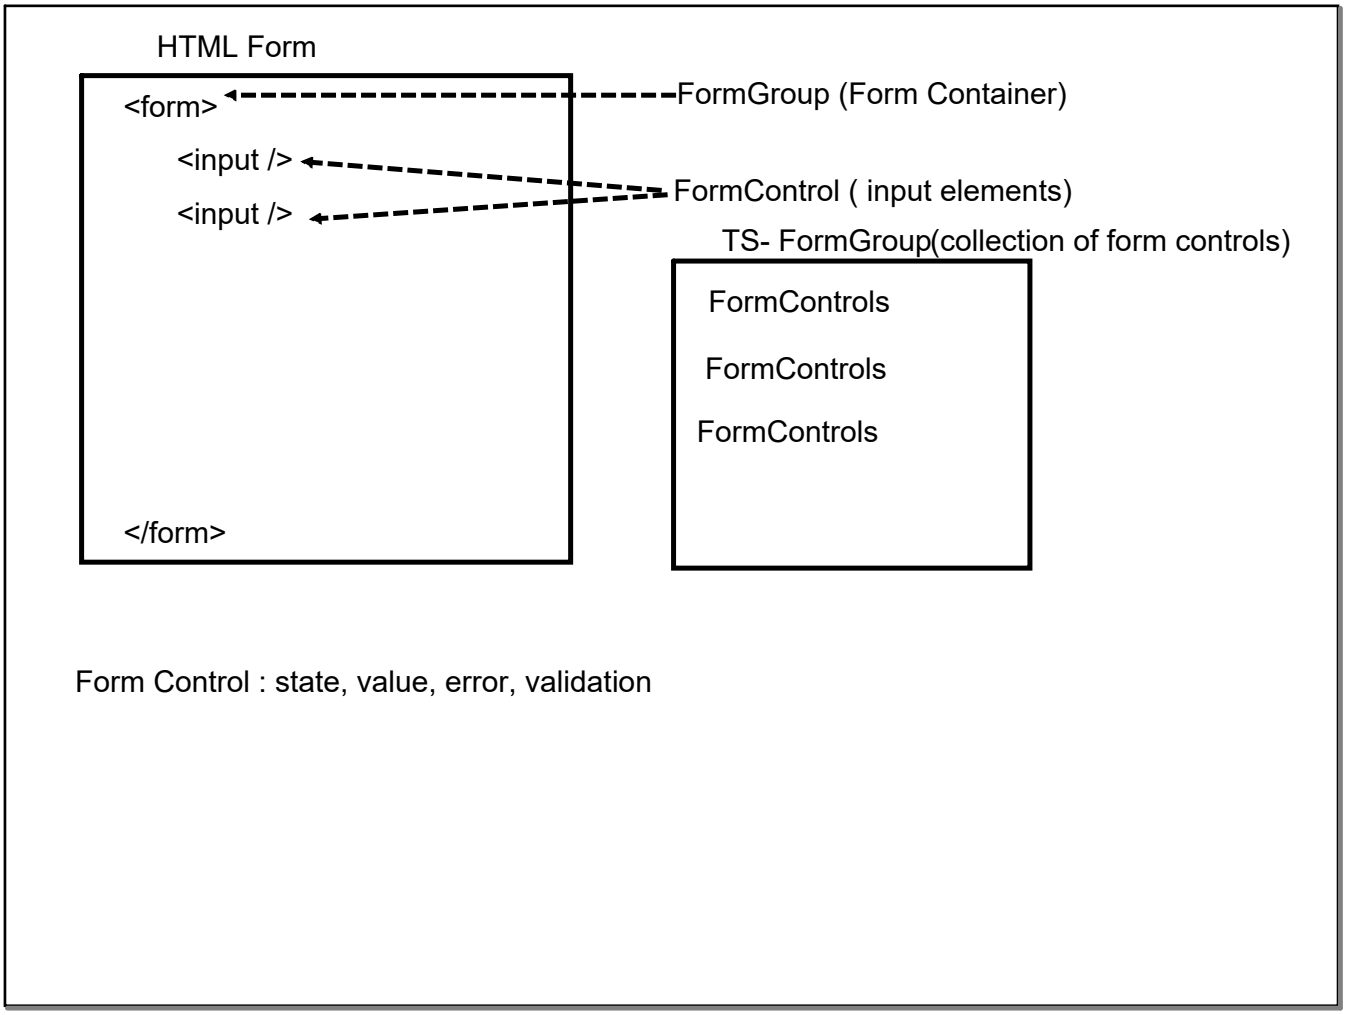
TS

Angular Object

HTML

Object Oriented Implementation

DOM Object : JS



Form Control : state, value, error, validation

FormsModule(Template)

FormGroup : ngForm (directive)

FormControl : ngModel (directive)

ReactiveFormsModule

FormsGroup : formGroup

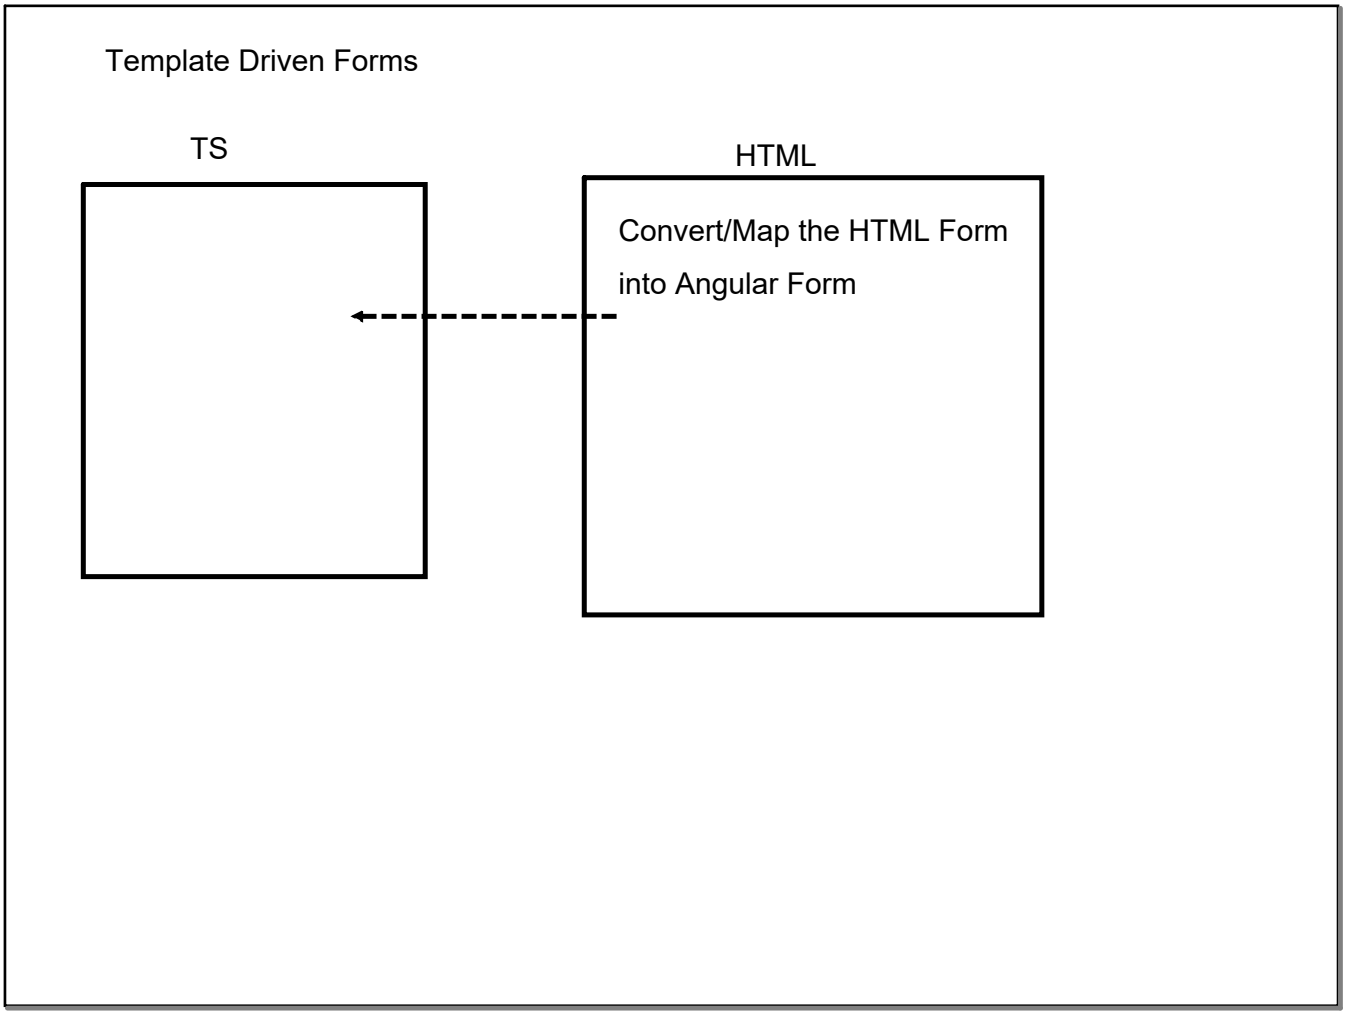
FormControl : formControl

#Need to add dependency of Module

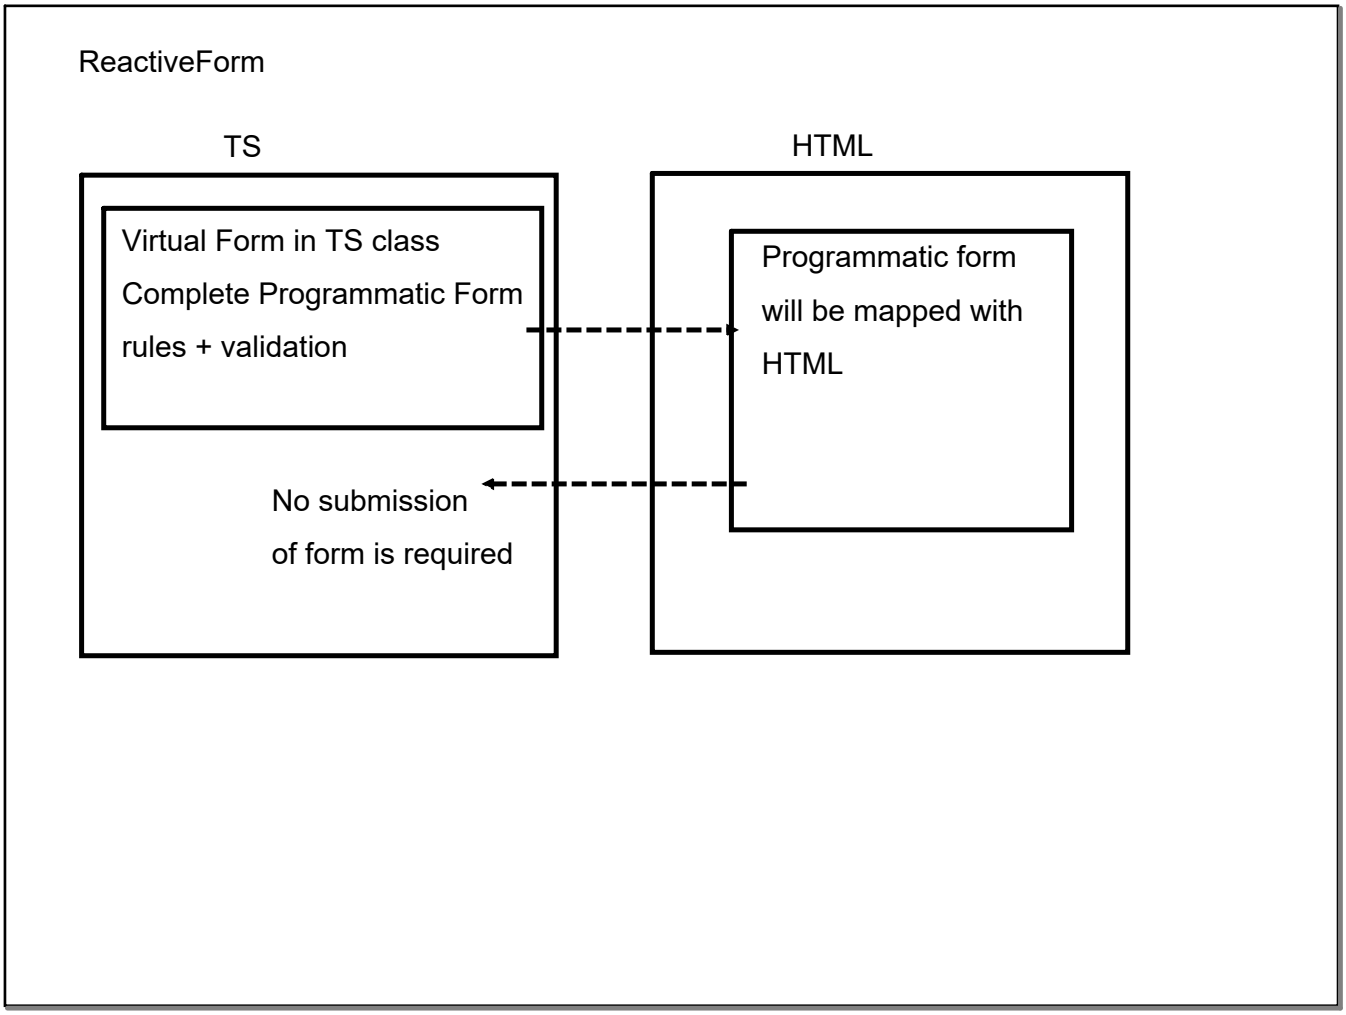
=> Mapping of HTML to Angular Object is done in view file

=> TS is not having much control over mapping

=> Not providing feature for Validation

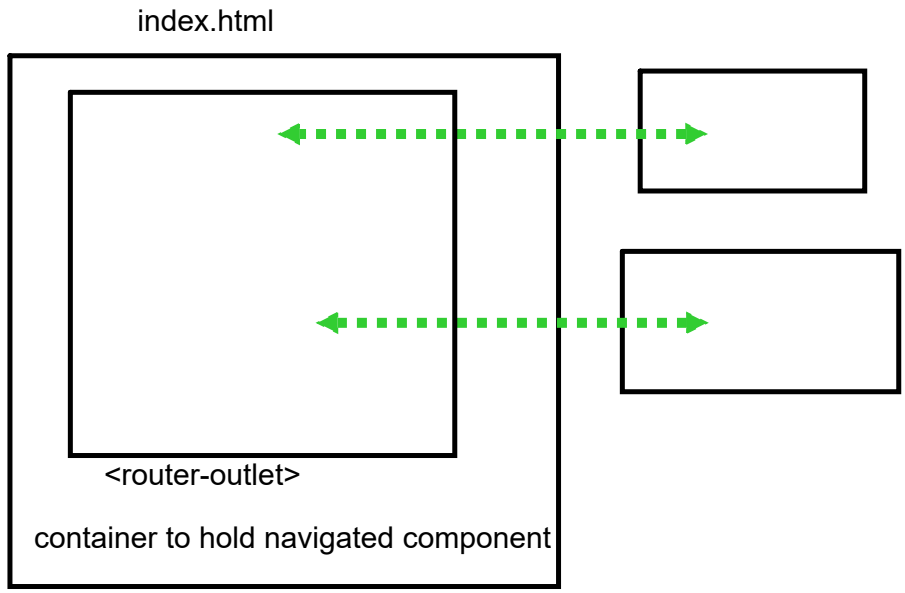


Template Driven Forms
TS
HTML
Convert/Map the HTML Form
into Angular Form

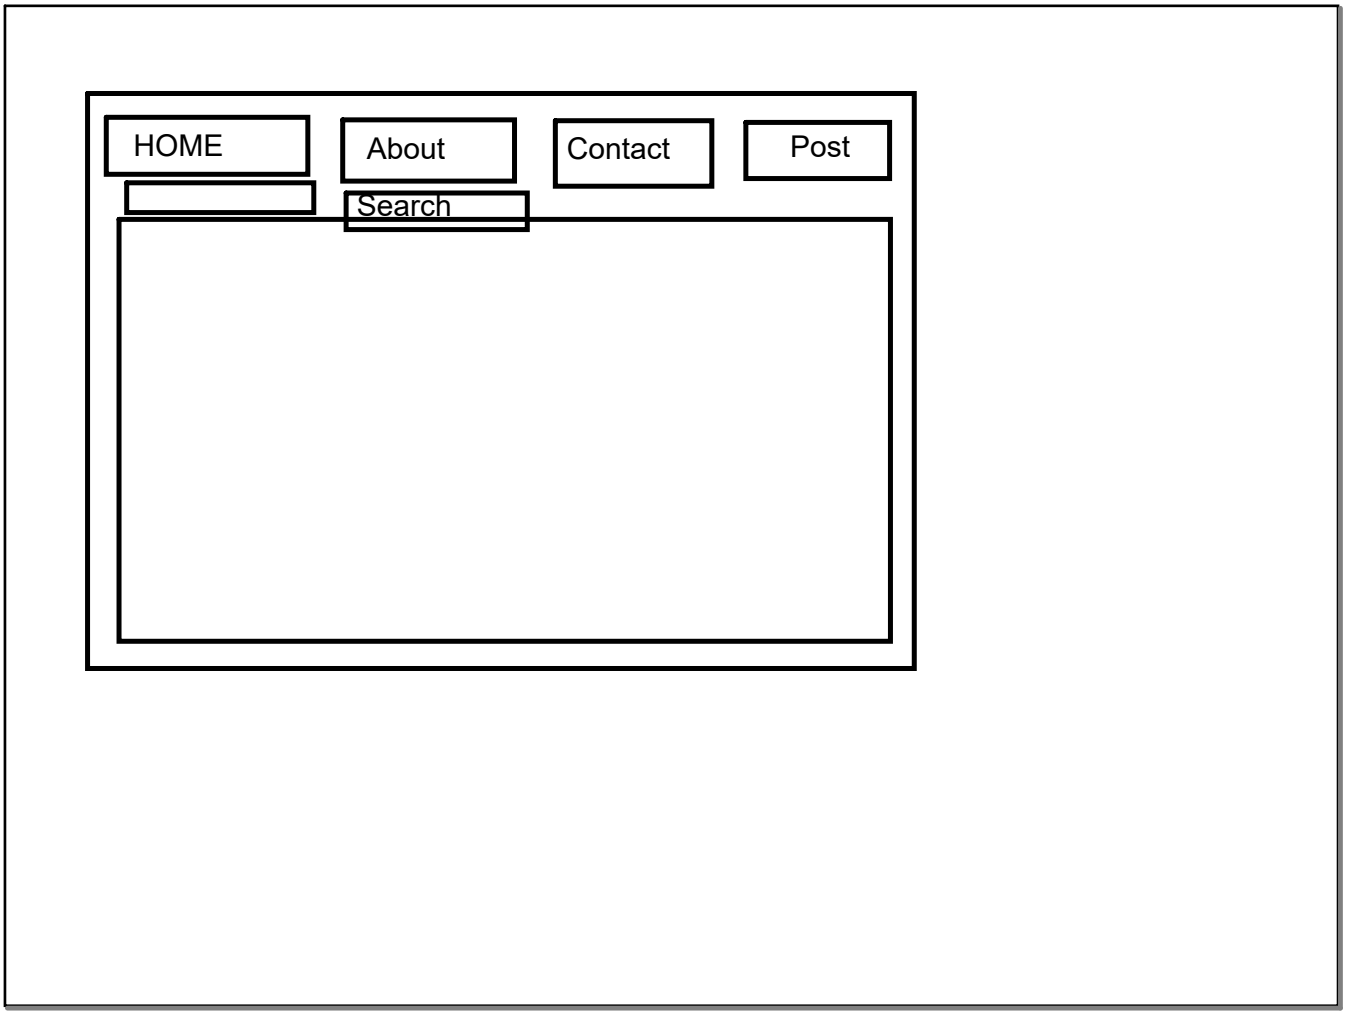


ReactiveForm
TS
HTML
Virtual Form in TS class
Complete Programmatic Form
rules + validation
Programmatic form
will be mapped with
HTML
No submission
of form is required

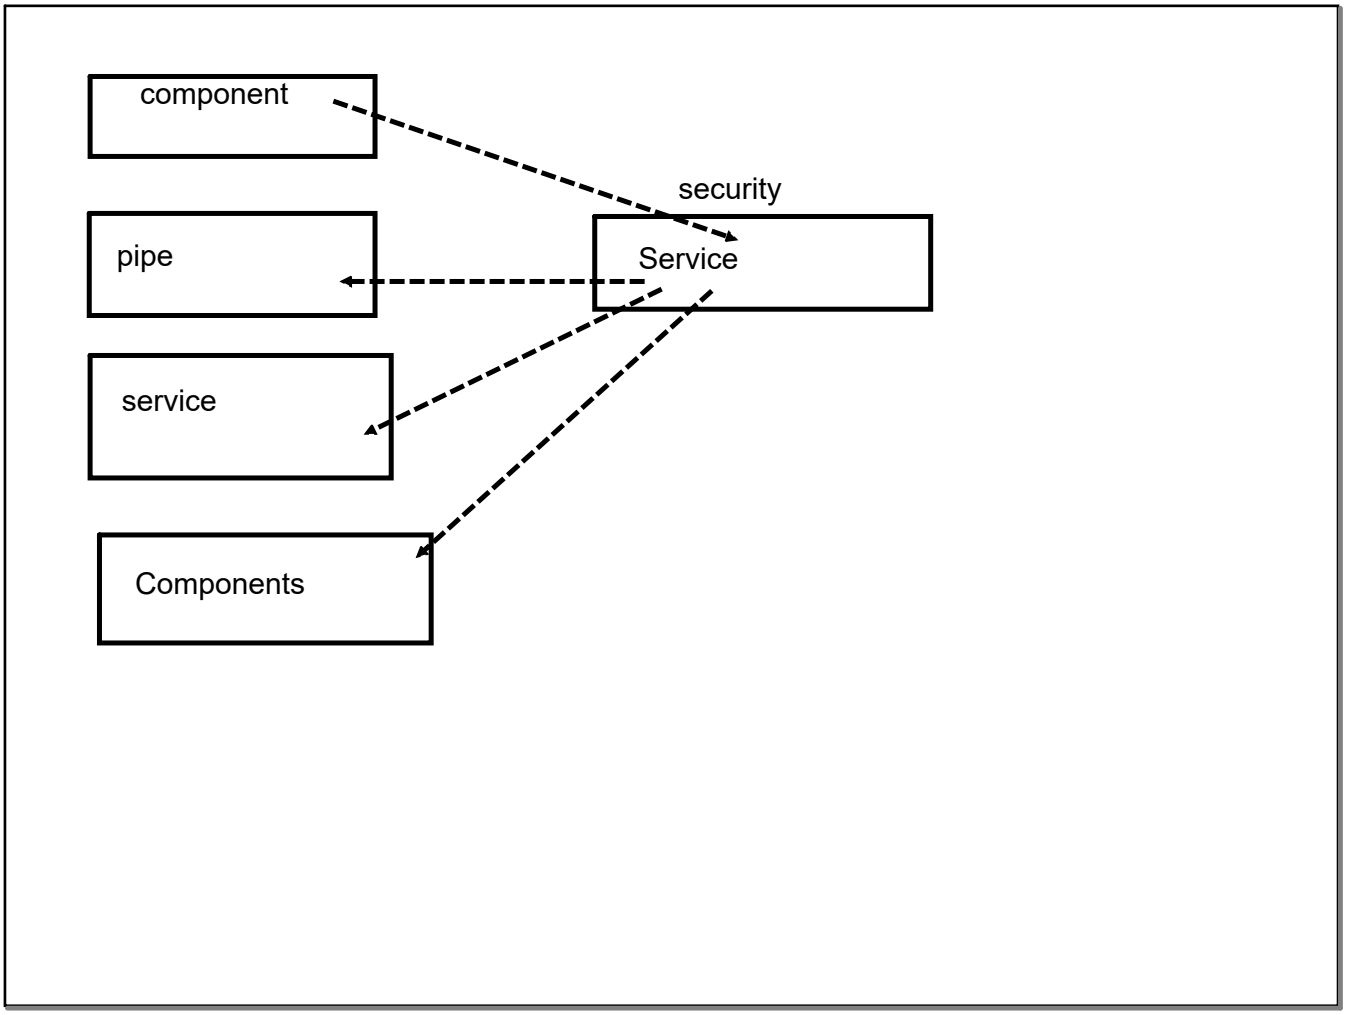
Routing : SPA



index.html
<router-outlet>
container to hold navigated component



HOME
About
Contact
Post
Search

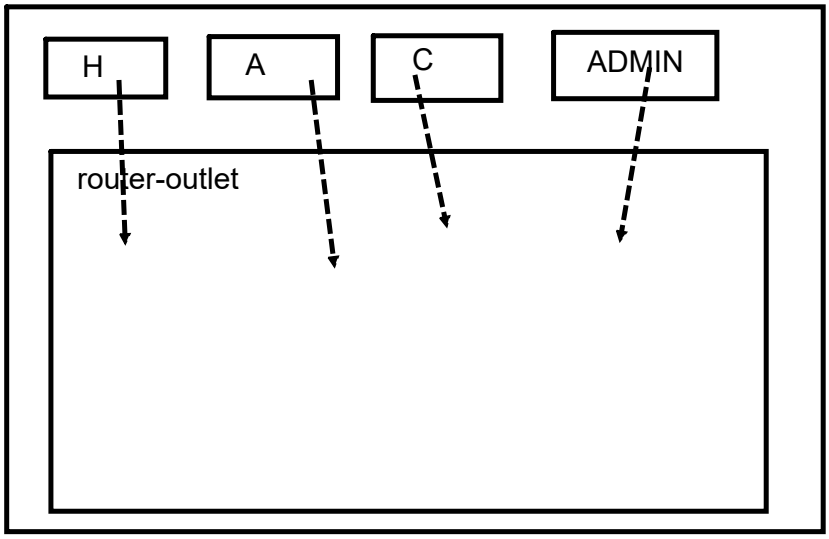


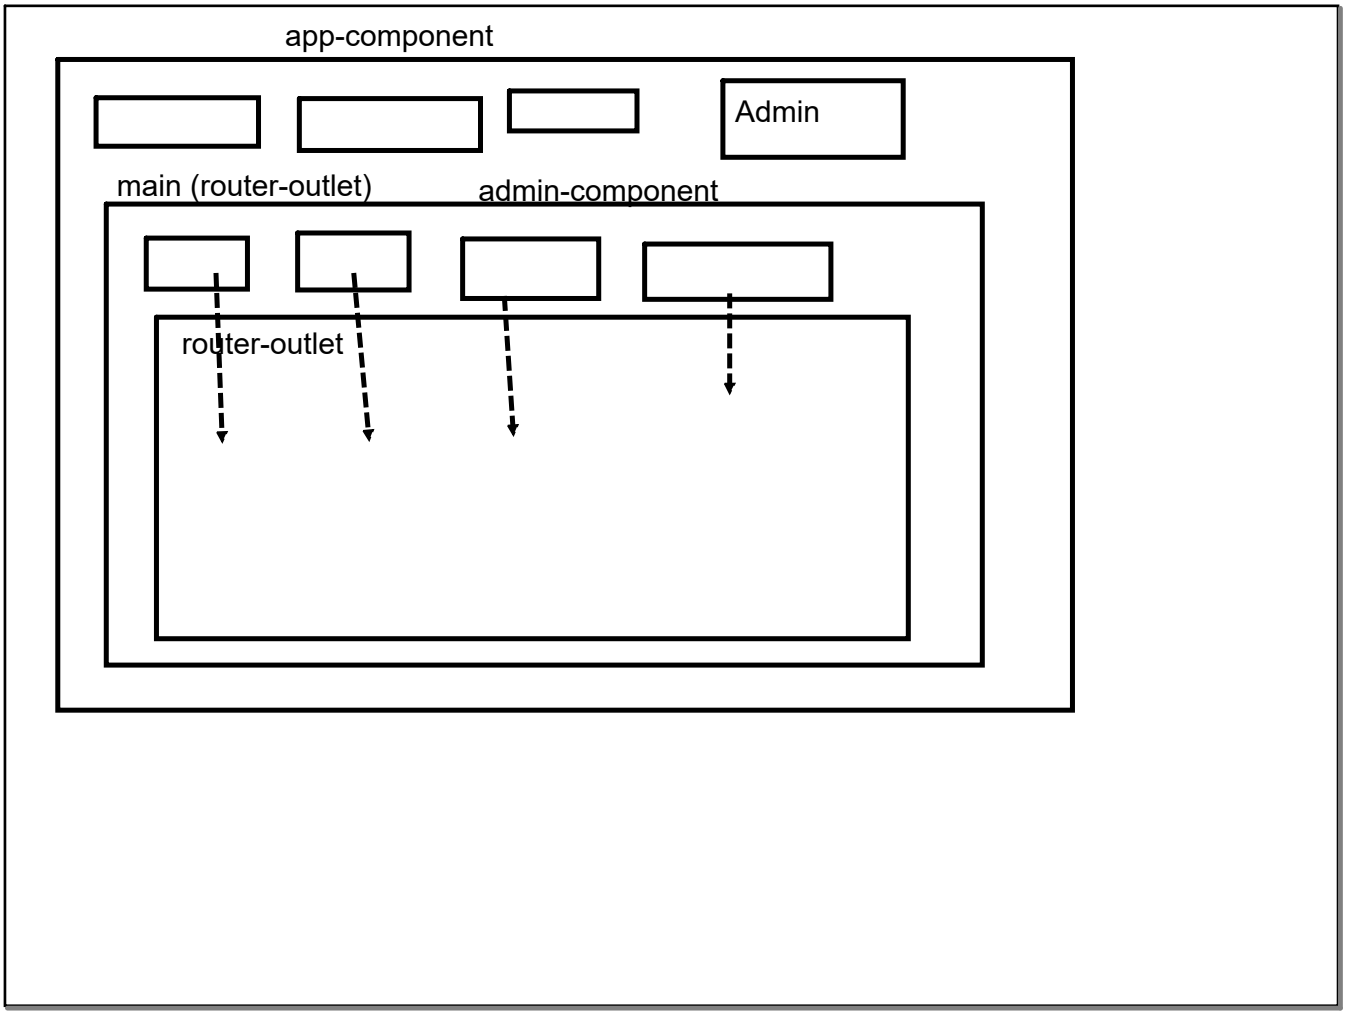
component
security
pipe
Service
service
Components

Primary Routing Module

Securing url/route (component)

Auth-Guard Service





app-component
Admin
main (router-outlet)
admin-component
router-outlet

HttpClientModule : Http-Service

Dummy Server/Fake REST API : json-server

1. Allows you to use a json file as the backend DB
2. Exposes all Rest Endpoints on that Json File

Install : Json Server :

```
>npm install -g json-server
```

http://localhost:3000/post : GET (get all)

http://localhost:3000/post/1 : GET (get by id)

http://localhost:3000/post : POST (new post) return the newly added record

http://localhost:3000/post : PUT (edit post) return the newly edited record

http://localhost:3000/post/1 : DELETE (delete that record)

JS : ES

Standard ES5 : support is by default available

jquery :

Library of JS (ES5):

ReactJS is just a library : exclusive to build effecient UI (V part of MVC)

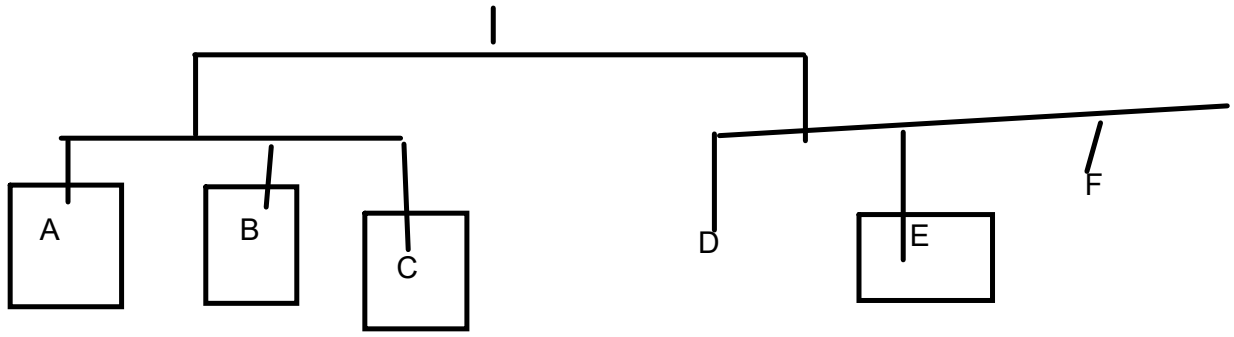
Build UI of large complex application (frequently changing data)

: Renderring would be frequent

Traditional approach of page renderring:

Browser :

DOM TREE



IF any change in any part of DOM Tree, complete Tree is re-renderring

ReactJS : ES6 : needs to be transpiled : can't be directly used on browsers

React Component : JS functions : which generates an (UI) output whenever it is called

eg : render()

generates some output

```
<div>
    <h2>Hello All</h2>
    <p>10:30 AM</p>   // programmatically
</div>
```

ReactJS : Virtual DOM

In-memory representation of real DOM:

diffing engine :

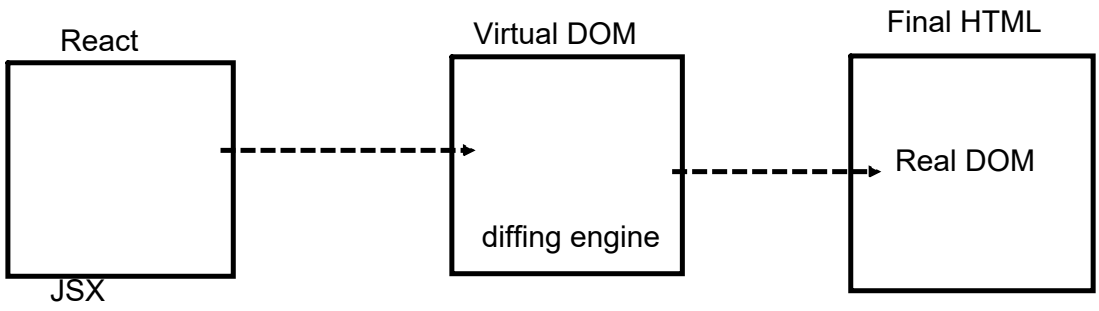
called after 1 min

only <p> component

```
<div>
    <h2>Hello All</h2>
    <p>10:31 AM</p>   // programmatically
</div>
```

```
    document.getElementById("resp").value=""; // REACT JS Approach (granular approach)
    ES5 approach

ReactJS Component is JS Function
render(){
      // code a code generate a UI
      // JSX syntax : JavaScriptXml Syntax
      Integrates Javascript with HTML
}
```



React JS Library

Two Library

1. react : Main ReactJS lib
2. react-dom : Virtual DOM

> npm tool

for managing everything about ReactJS application

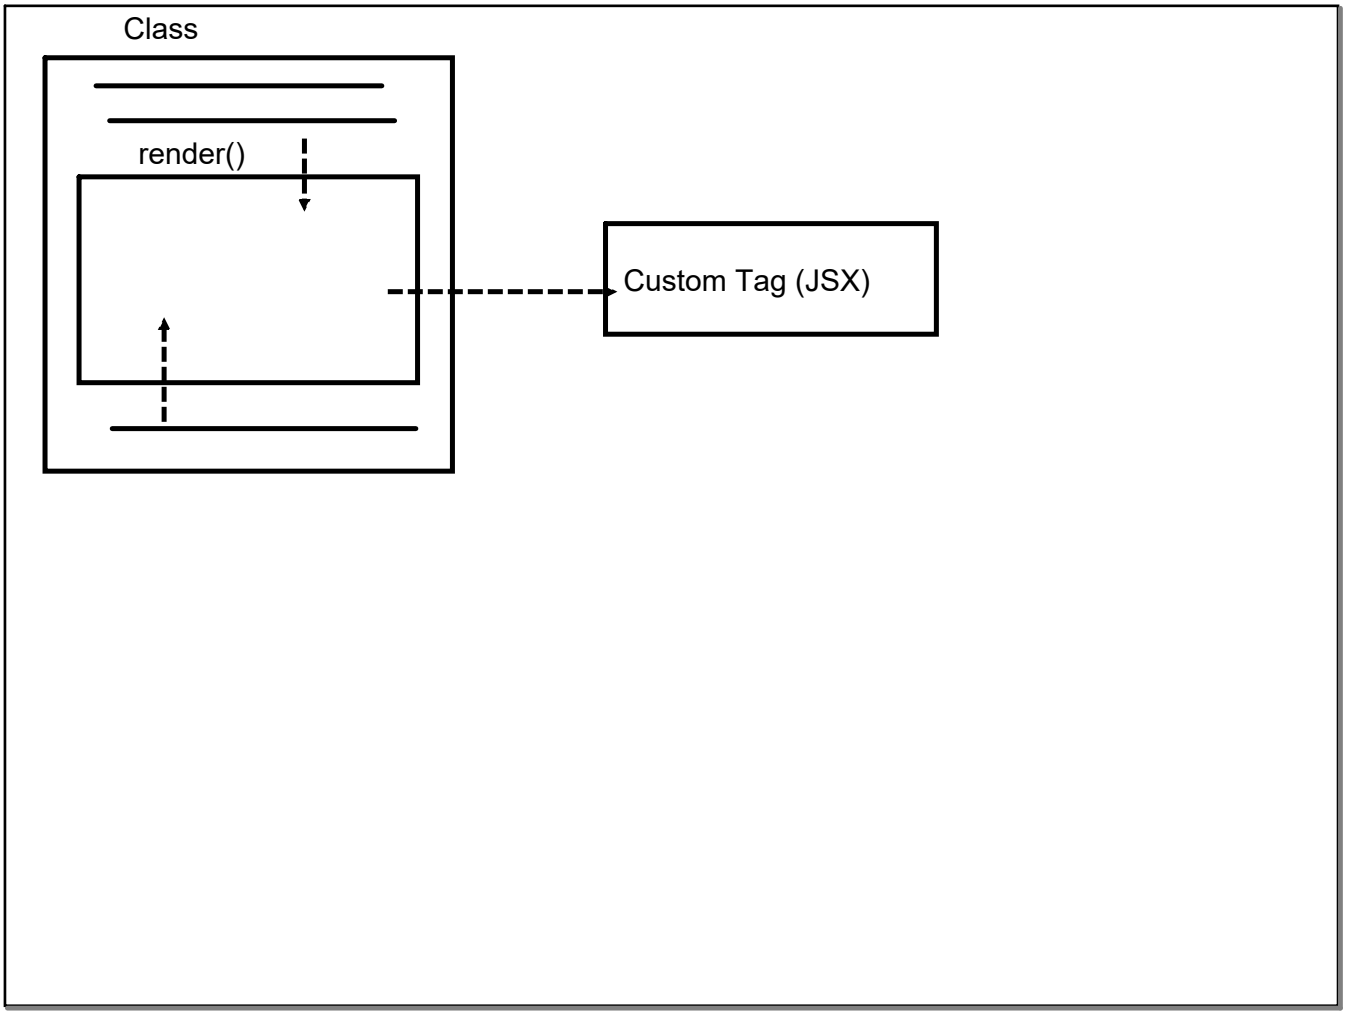
create-react-app (cli)

install:

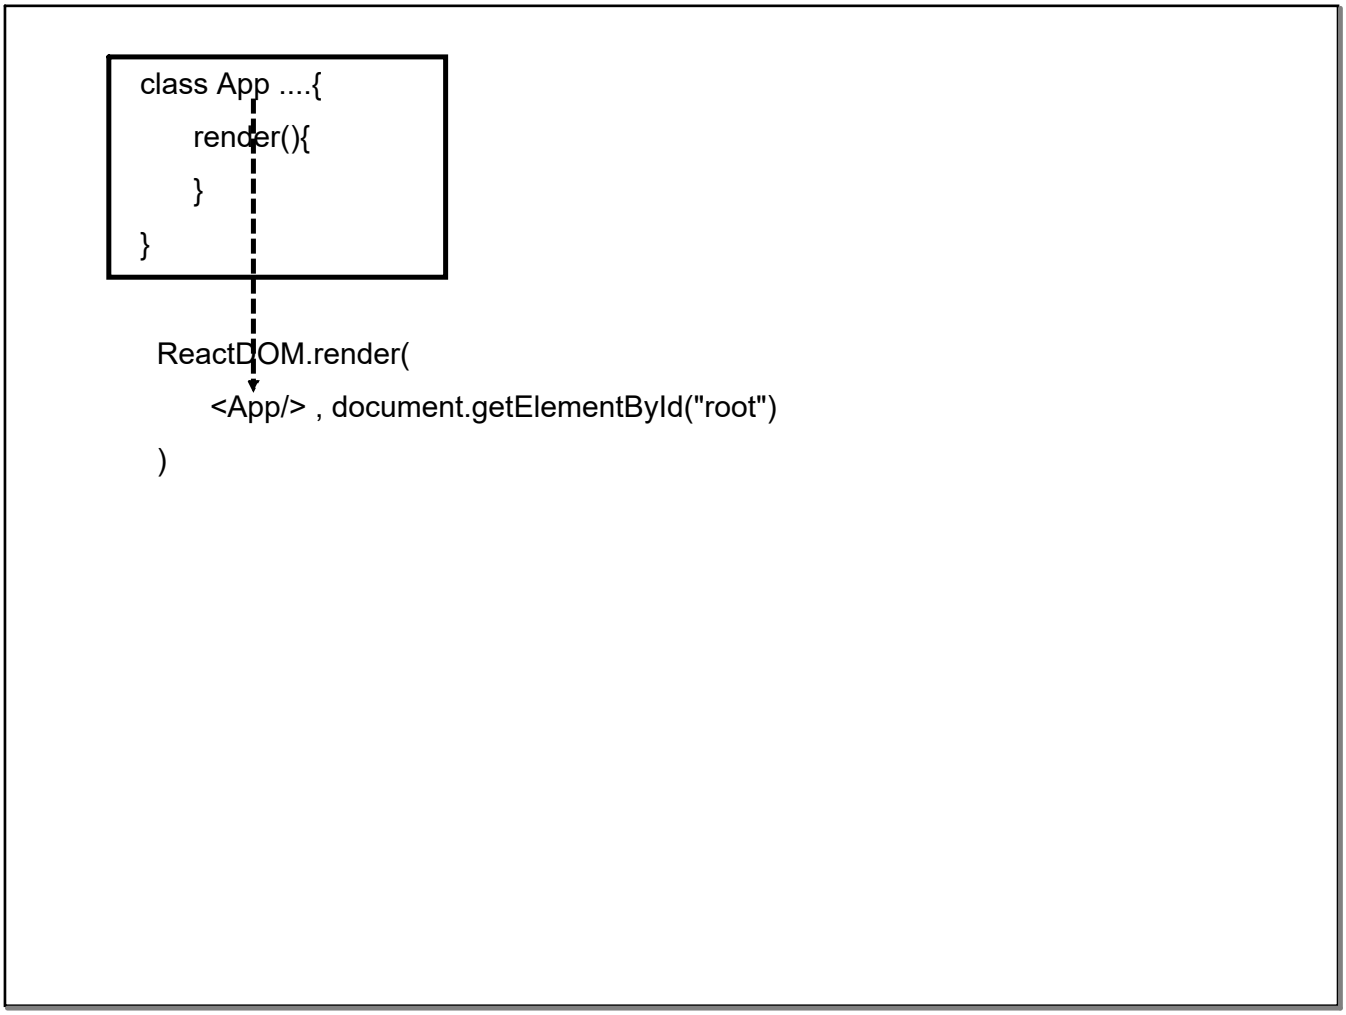
> npm install -g create-react-app

After installed

> create-react-app <app-name>



Class
render()
Custom Tag (JSX)



class App ....{
render(){

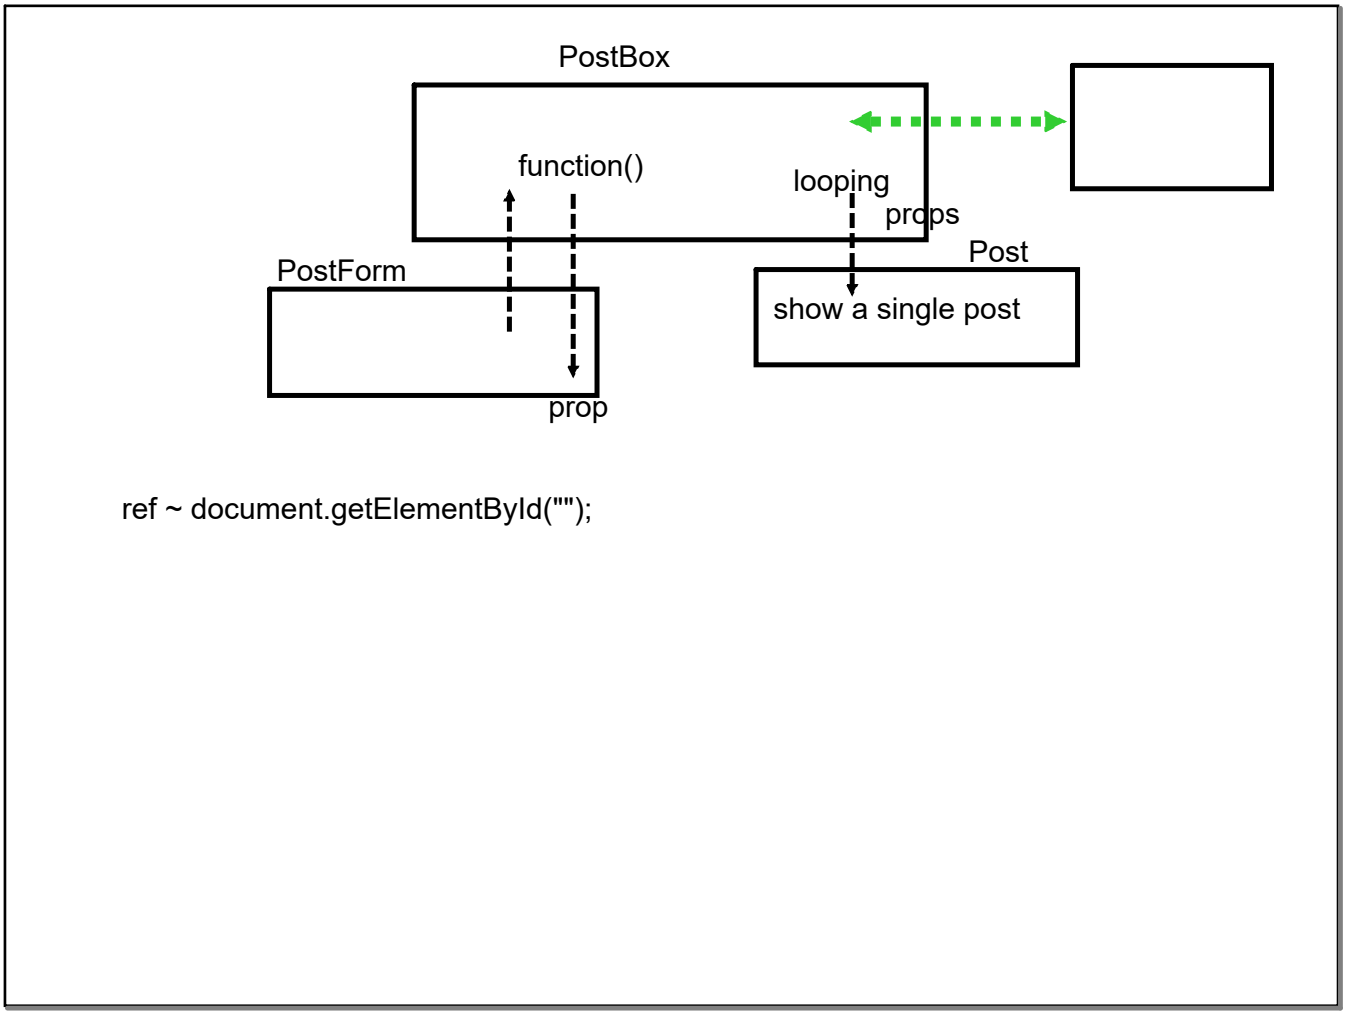
render() method call is going to define the UI change

Call to render is controlled by few factor

1. Props : any change in prop value would trigger render() call
2. State : inbuilt object (exclusive to a component) : any change will trigger render call



ref ~ document.getElementById("");

Make app talk with backend-server async

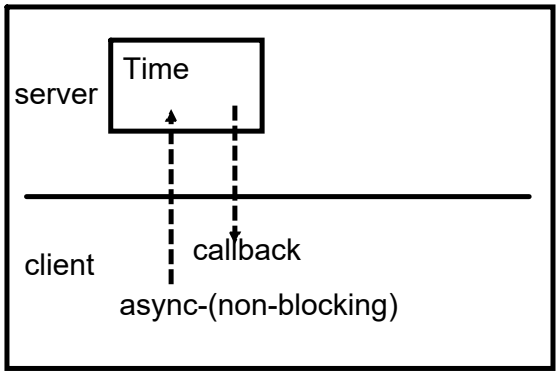
AJAX call (jquery)

1. Traditional way : CDN Link / download lib

2. npm way

install and save dependency in package.json

>npm install --save jquery



Life Cycle of React Component :

When a component is used for renderring

Instance is created

1. constructor
2. componentWillMount() : before renderring
   (only once : first time rendering : not with every rendering)
3. render() : (first call)
4. componentDidMount() : just after render (only once : after first rendering)

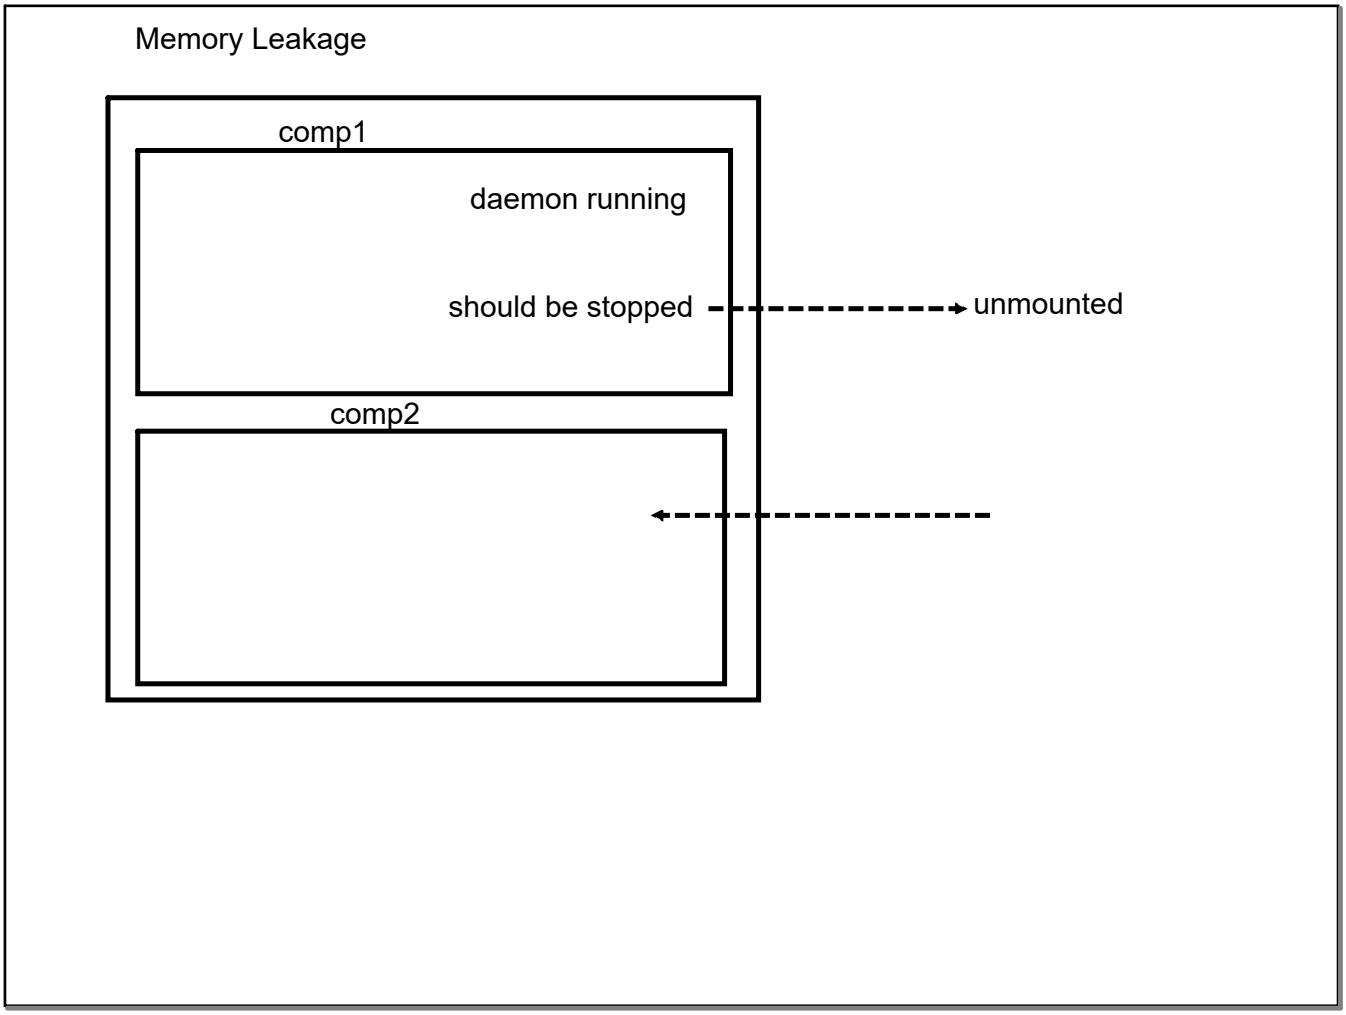
5. componentWillReceiveProps() ;
   whenever prop/state change
   invoked before next rendering (before every re-rendering)
6. shouldComponentUpdate()
   #allows to customize the flow

returns boolean :

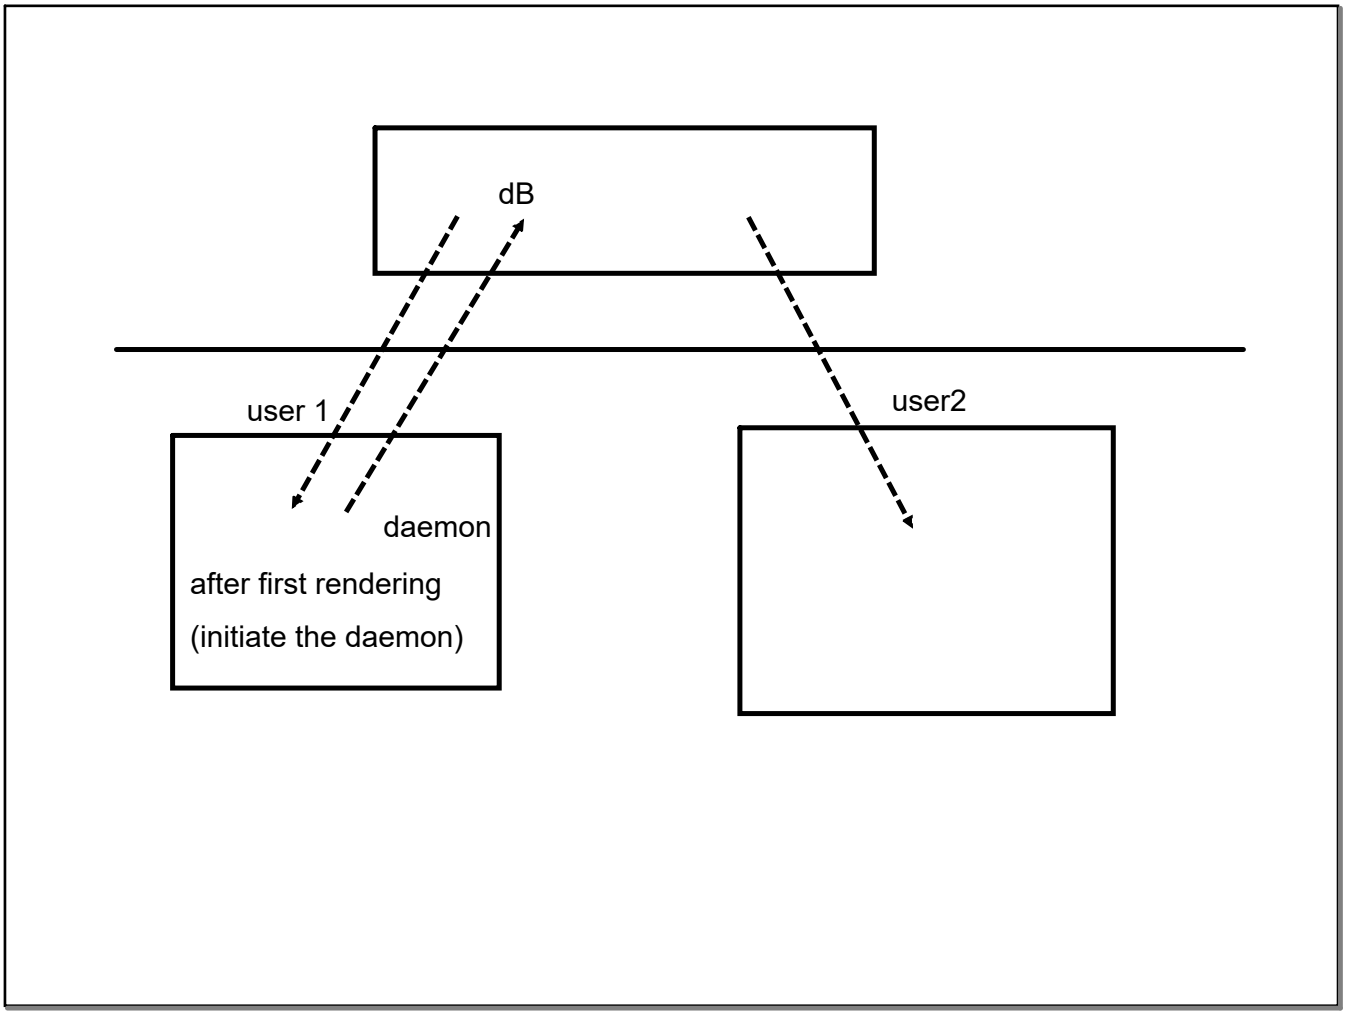
   true : re-rendering
   false : no re-rendering

7. componentWillUpdate() : only of true is returned
8. render () : re-rendering
9. componentDidUpdate(); just after re-rendering
10. componentWillUnmount() : component is removed from Virtual DOM

Netty Server

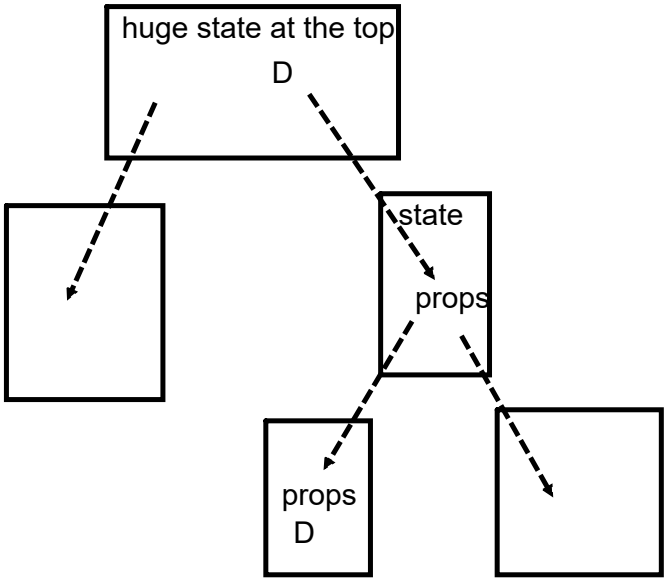


Memory Leakage
comp1
daemon running
should be stopped
unmounted
comp2



dB
user 1
user2
daemon
after first rendering
(initiate the daemon)

Flux Design Pattern (Redux API)



Data Flow

(inbox)list of email:

list -> email view

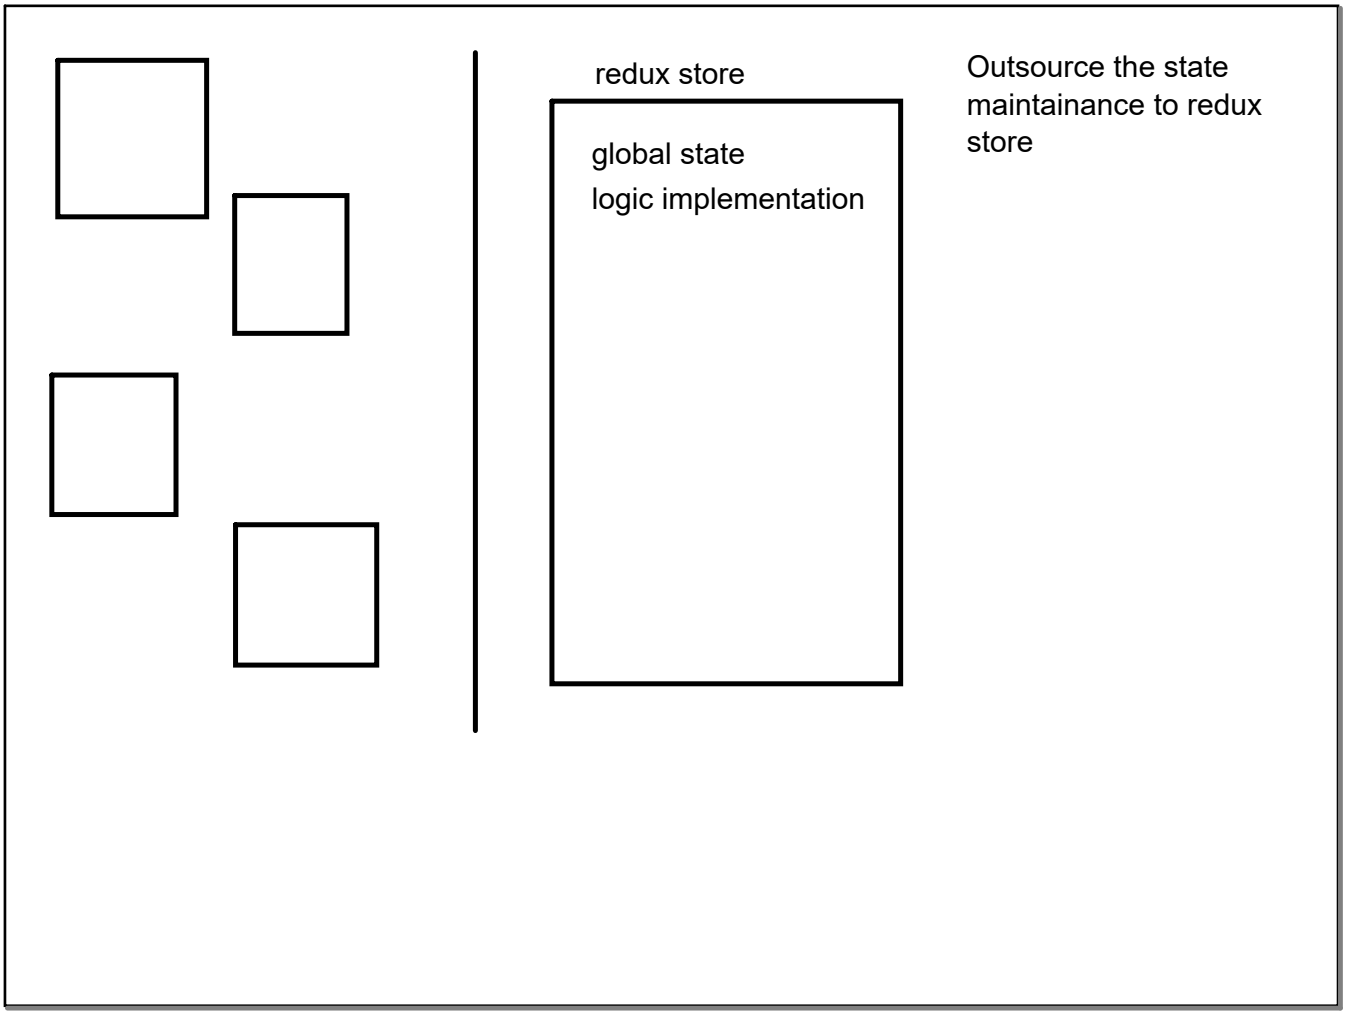
#fetch the data of that email from server

mark as read

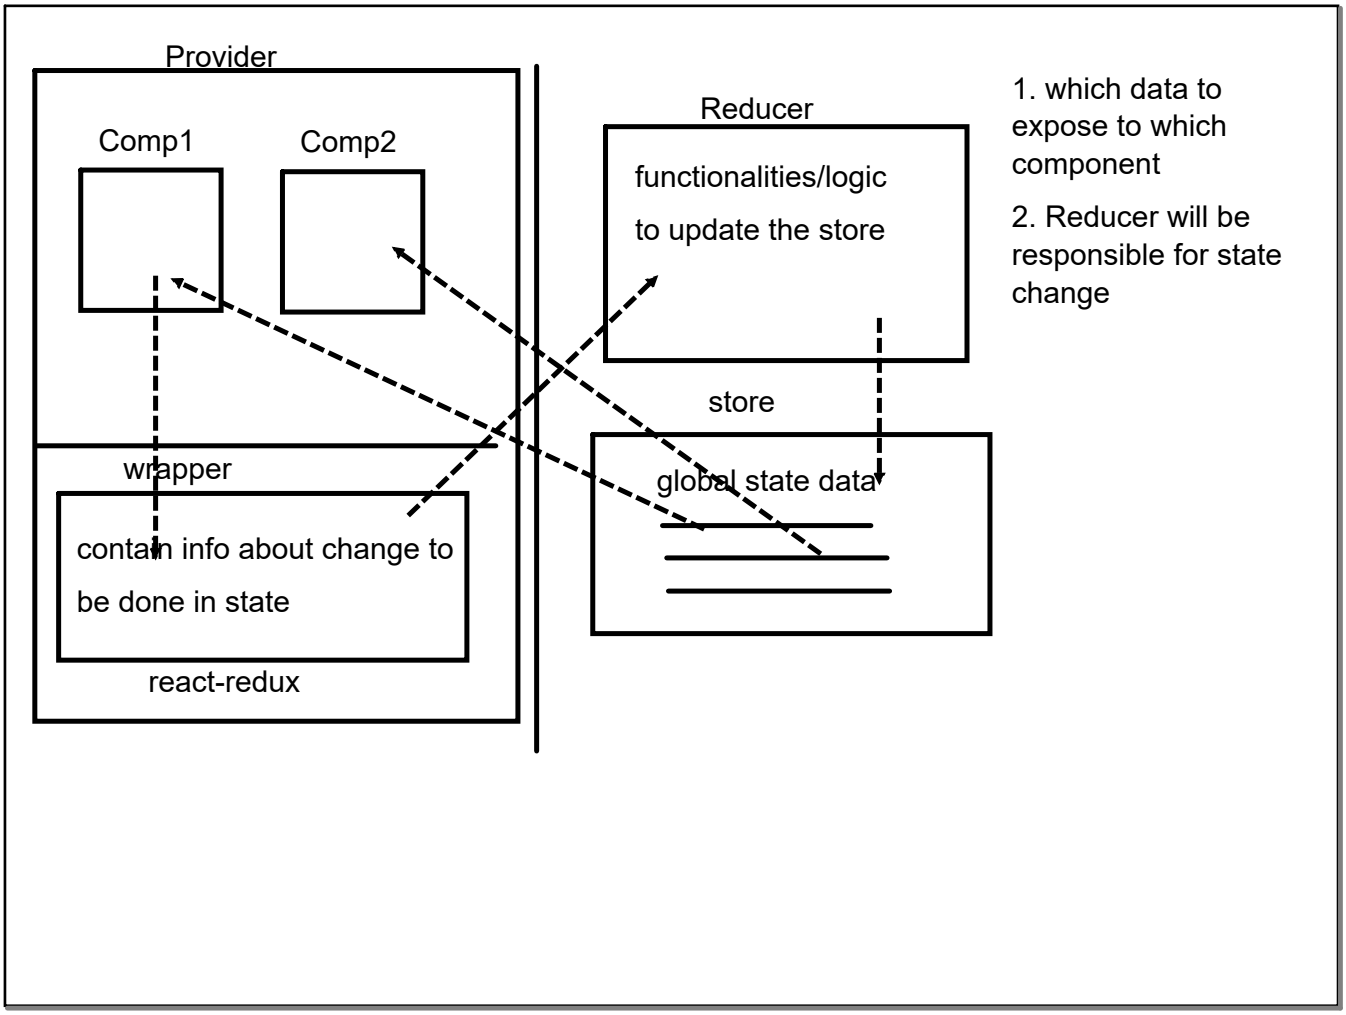
unread mail counter needs to be reduced

url to be changed

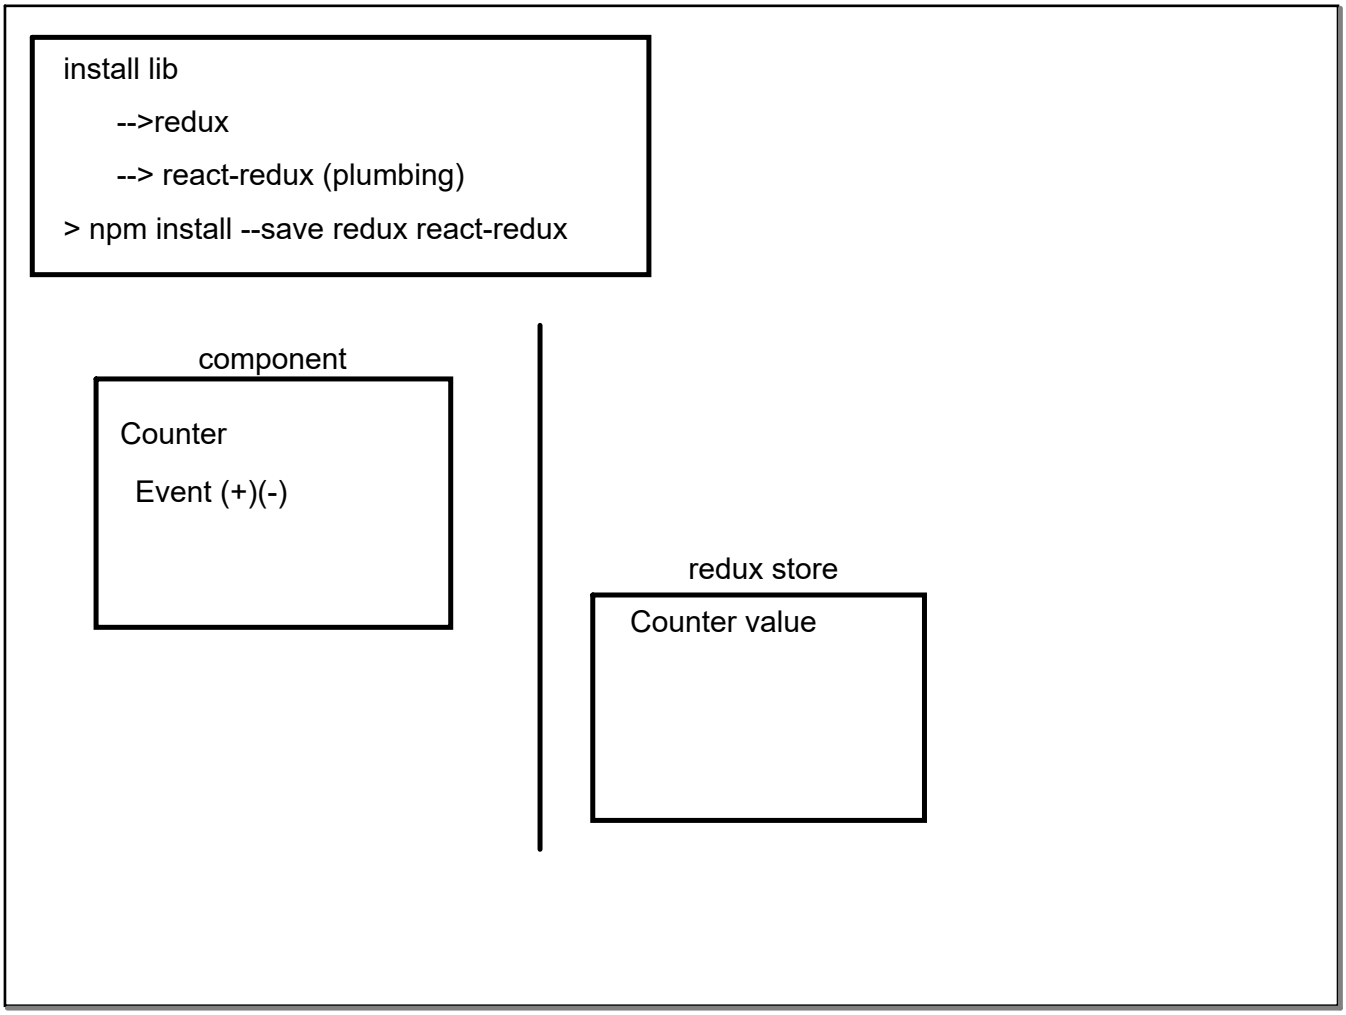
all update needs to sent to server



redux store
global state
logic implementation
Outsource the state maintainance to redux store



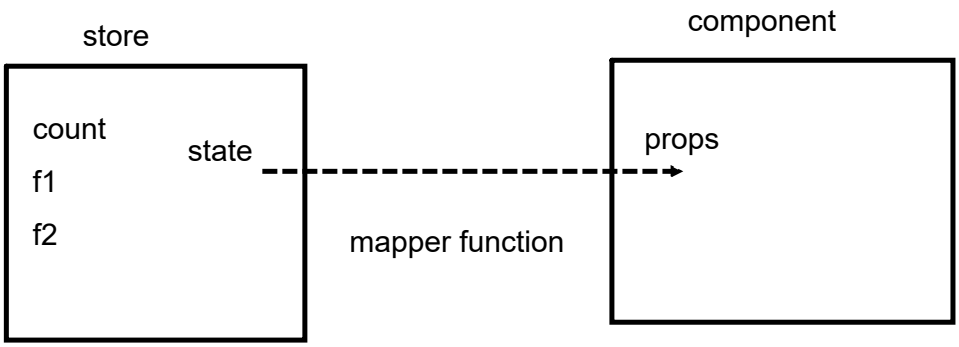
Provider
Comp1
Comp2
wrapper
contain info about change to
be done in state
react-redux
Reducer
functionalities/logic
to update the store
store
global state data
1. which data to expose to which component
2. Reducer will be responsible for state change



install lib
-->redux
--> react-redux (plumbing)
> npm install --save redux react-redux
component
Counter
Event (+)(-)
redux store
Counter value

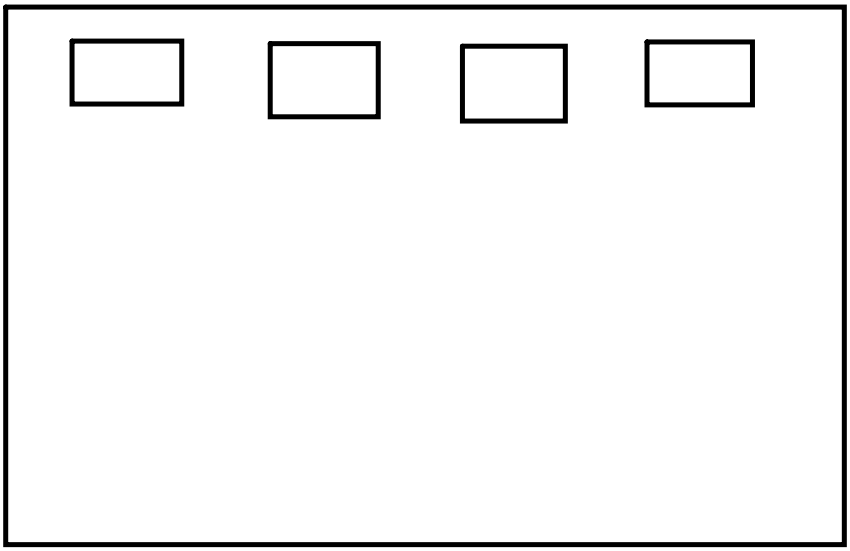
create a store management resource
expose the store to react component
configure the component to use store

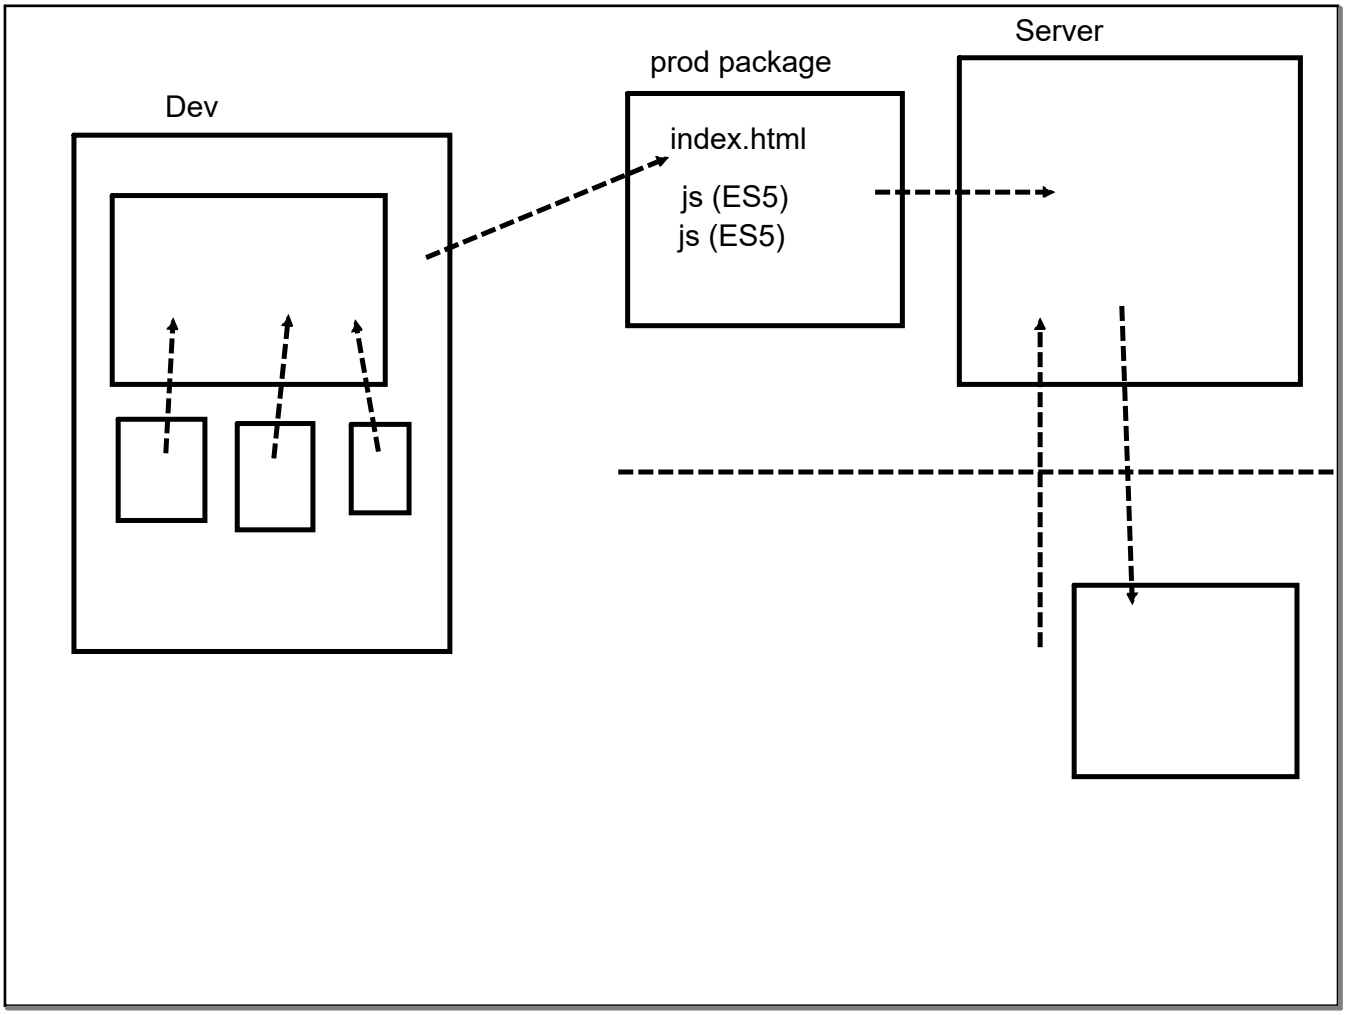
Need to map state(redux-store) data to props for component



install an API for routing

> npm install --save react-router-dom





Server
prod package
Dev
index.html
js (ES5)
js (ES5)

MongoDB

High Performance : No SQL overheads

Document Oriented database

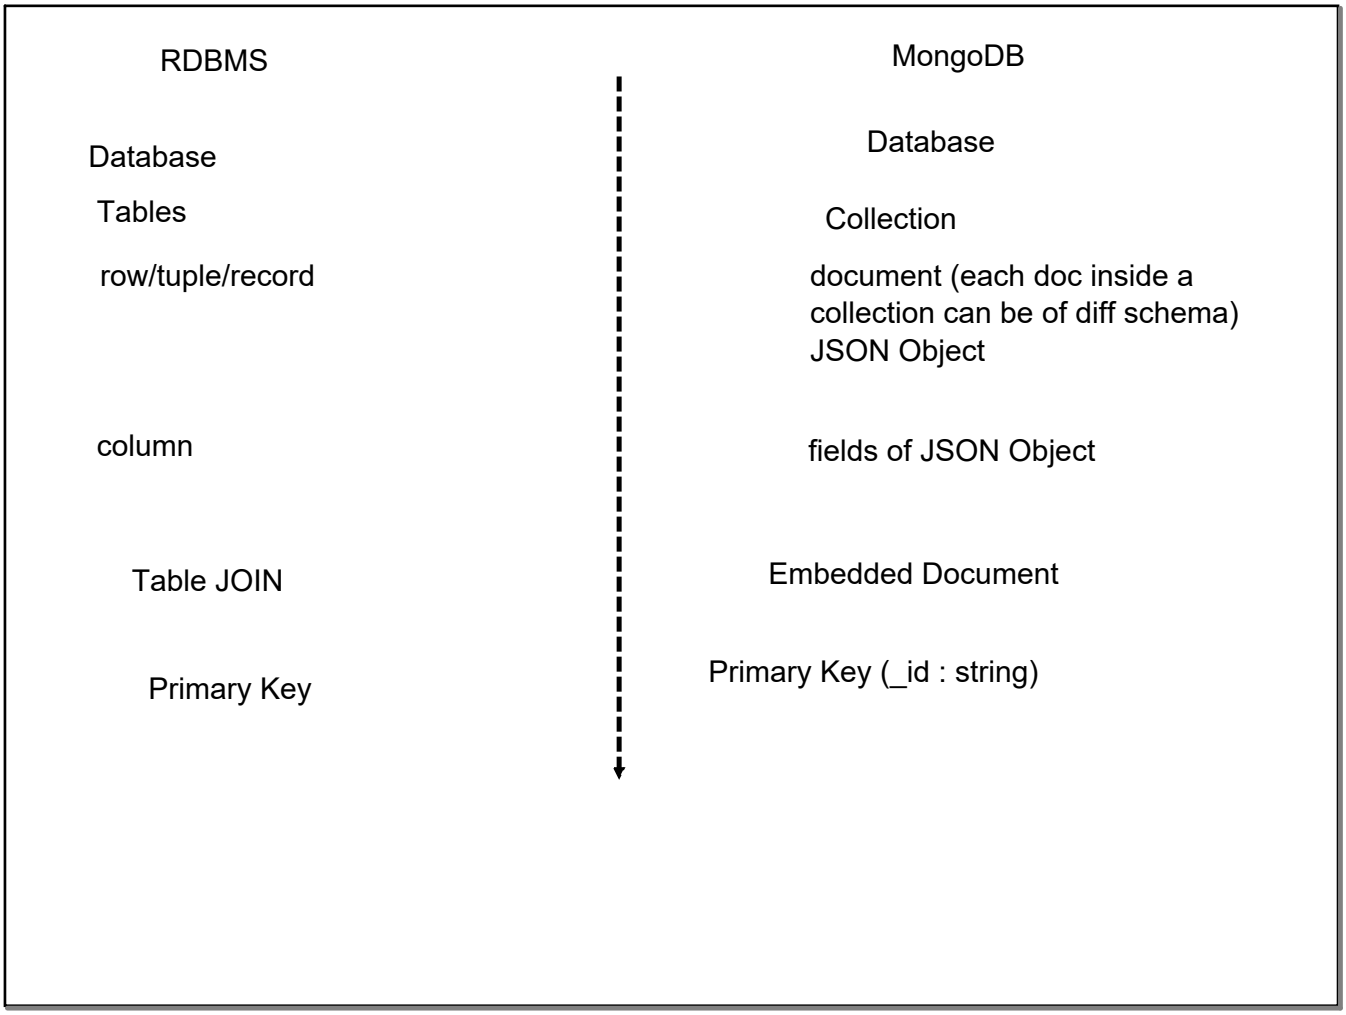
Schema Less :

Json Object Format

Document based Query ~ Deep query-ability

Easy to scale (no constraints)

Reactive Driver for MongoDb : End to End Reactive App



RDBMS
MongoDB
Database
Database
Tables
Collection
row/tuple/record
document (each doc inside a collection can be of diff schema)
JSON Object
column
fields of JSON Object
Table JOIN
Embedded Document
Primary Key
Primary Key (_id : string)

Using MongoDb in applications

Table

all records must follow the tableschema

Collection (Table)

Doc

```
{
    id: 1,
    name : "First",
    email : "first@mail.com"
},
{
    _id : hflhdf,
    studentName : "",
    gpa : 3.4
    grade : 2
}
```

Using MongoDb

1. Embedded Mongo DB (in memory DB)
2. MongoDb Community Server (download and install)
3. MongoDb Atlas (Over cloud)

MongoDb Compass : GUI interface :

CLI

mongod : Mongo Db Server : mongod --dbpath "C:\data"

mongo : Mongo Db Client : mongo

Have a location on machine to store data

c:\data : #needs to specified while launching server

mongodb uri :

uri : mongodb://[username]:[password]@[ip]:[port]/<dbname>

Index :

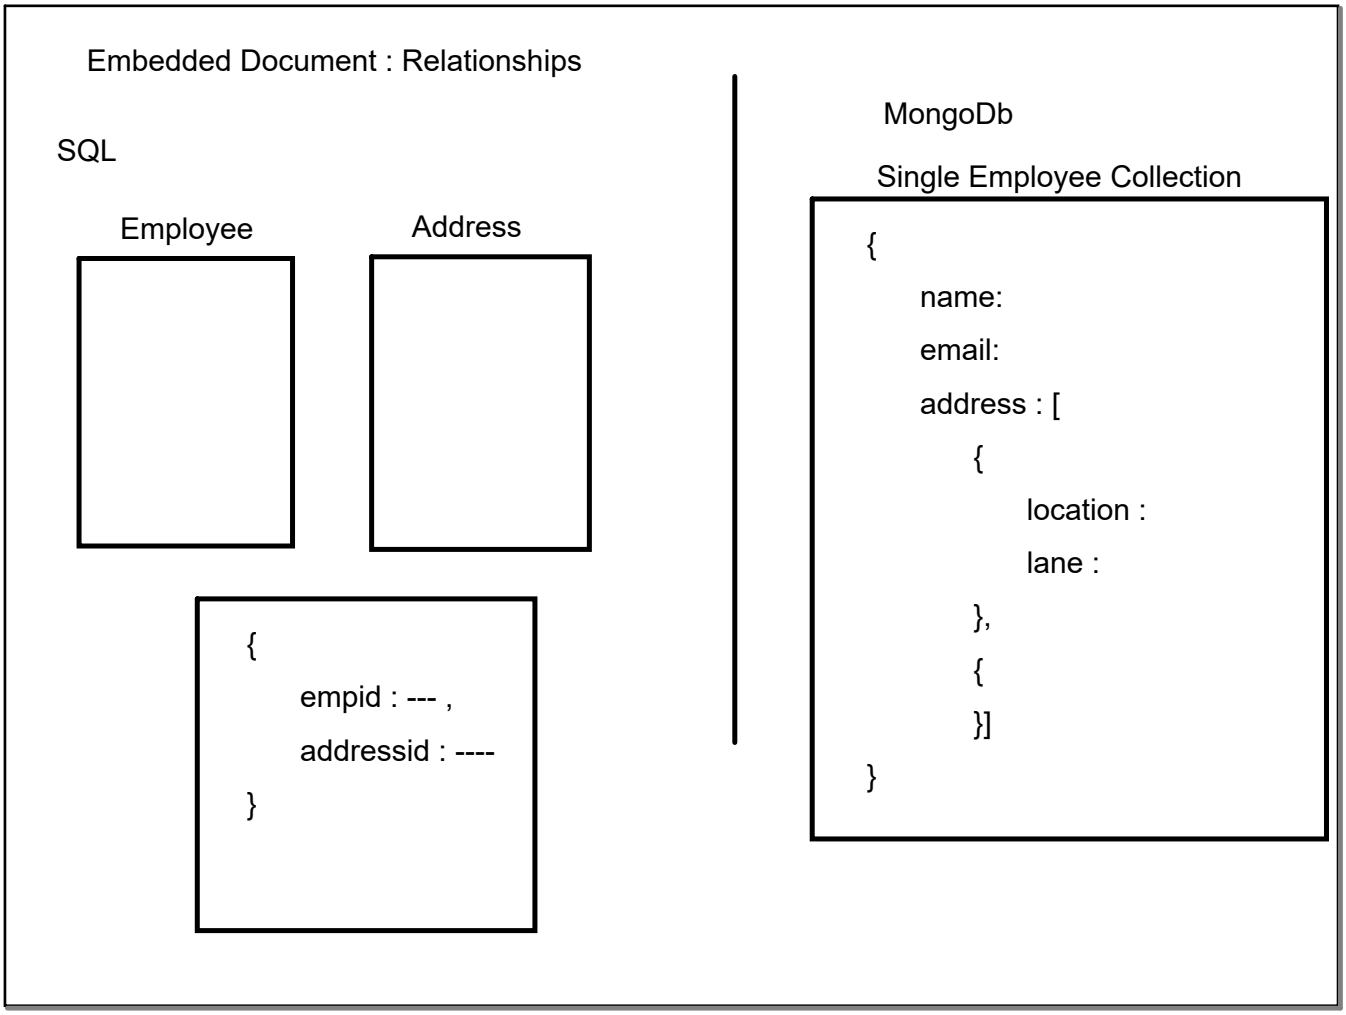
db.<collection>.createIndex({<fldname> : 1/-1, <fldname> : 1/-1})

1 : asc

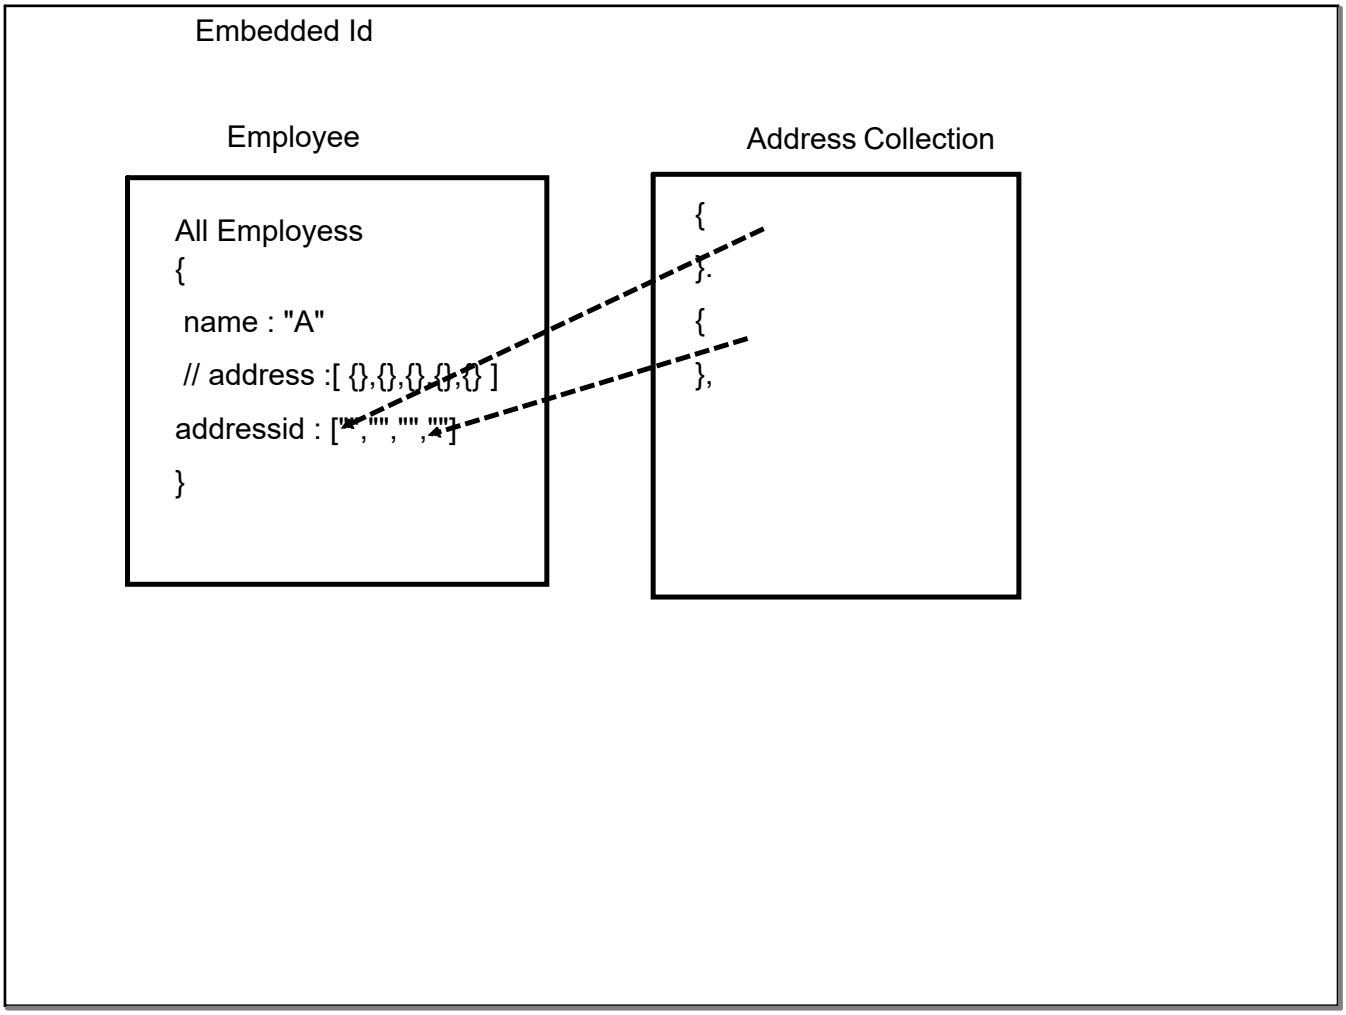
-1 :desc

db.<collection>.getIndexes()

<date time > : key criteria



Embedded Document : Relationships
SQL
Employee
Address
{
empid : --- ,
addressid : ----
}
MongoDb
Single Employee Collection
{
name:
email:
address : [
{
location :
lane :
},
{
}]
}



Embedded Id
Employee
Address Collection
All Employess
{
name : "A"
// address :[{},{},{},{},{}]
addressid : ["","","",""]
}
{
}.
{
},

@Transactional

1. By default implement everything in views :
2. Commit only if all activities are success
3. insert a new record : get a instance of newly added record

    # change values of that object : change the record in view

MongoDb : ACID Multi Document Acid Transaction (4.0

=> sharded documents ~ RDBMS Views

db.<collection>.start_transaction(s=session); // sharded document

db.<collection>.insert([{},{}], s);

db.--------

db.<collection>.commit_transaction();

Oracle Server

SQLPlus : Client (command terminal)

SQL Developer : GUI interface

PL/SQL : Procedural Extension language

portable

performance-oriented

transaction oriented

Structural:

PL/SQL Blocks

Procedure/Function

Anonymous/Named

```
DECLARE
     ---------
     ----------
BEGIN
     -----------
     -----------
EXCEPTION
     -----------------
     -----------------
END;
```

Variable follows the colomn naming convention / oracle type

Variable Declaration

```
<name> <type> NULL;
email varchar(20) NULL;
id int NOT NULL := 1;
msg varchar(20) DEFAULT 'Hello all'
```

Variables can be declared by getting properties from col of table

```
id employee.id%type :=1;
name employee.name%type;
```

PL/SQL can have nested scope : thus variables also have scope

```
DECLARE
    val1 number; -- global variables
BEGIN
    ------------------
    ------------------                    nested block
    DECLARE
        num1 number;   -- local variables
    BEGIN
        ----------------------
        ----------------------
    END;
    -----------------
END;
```

Decision Construct

IF-THEN-ELSE

IF <condition> THEN

ELSE / ELSEIF

END IF;

FOR i IN 1..10 LOOP

END loop;

STORED PROCEDURES/FUNCTION

PARAMETERS

IN : Input into sub-programs (read-only) : default

OUT : Output from sub-program (read/write)

IN OUT: INPUT,OUTPUT (read/write)

```
TEST_PROCEDURE(IN x, OUT y, INOUT z);
a=10;
b=20;
c=30;
CALL TEST_PROCEDURE(a,b,c);
b<--- 50
c<---100

Inside the Procedure
    x : 10
    y : null
    z : 30;
    y=50;
    z=100;
```

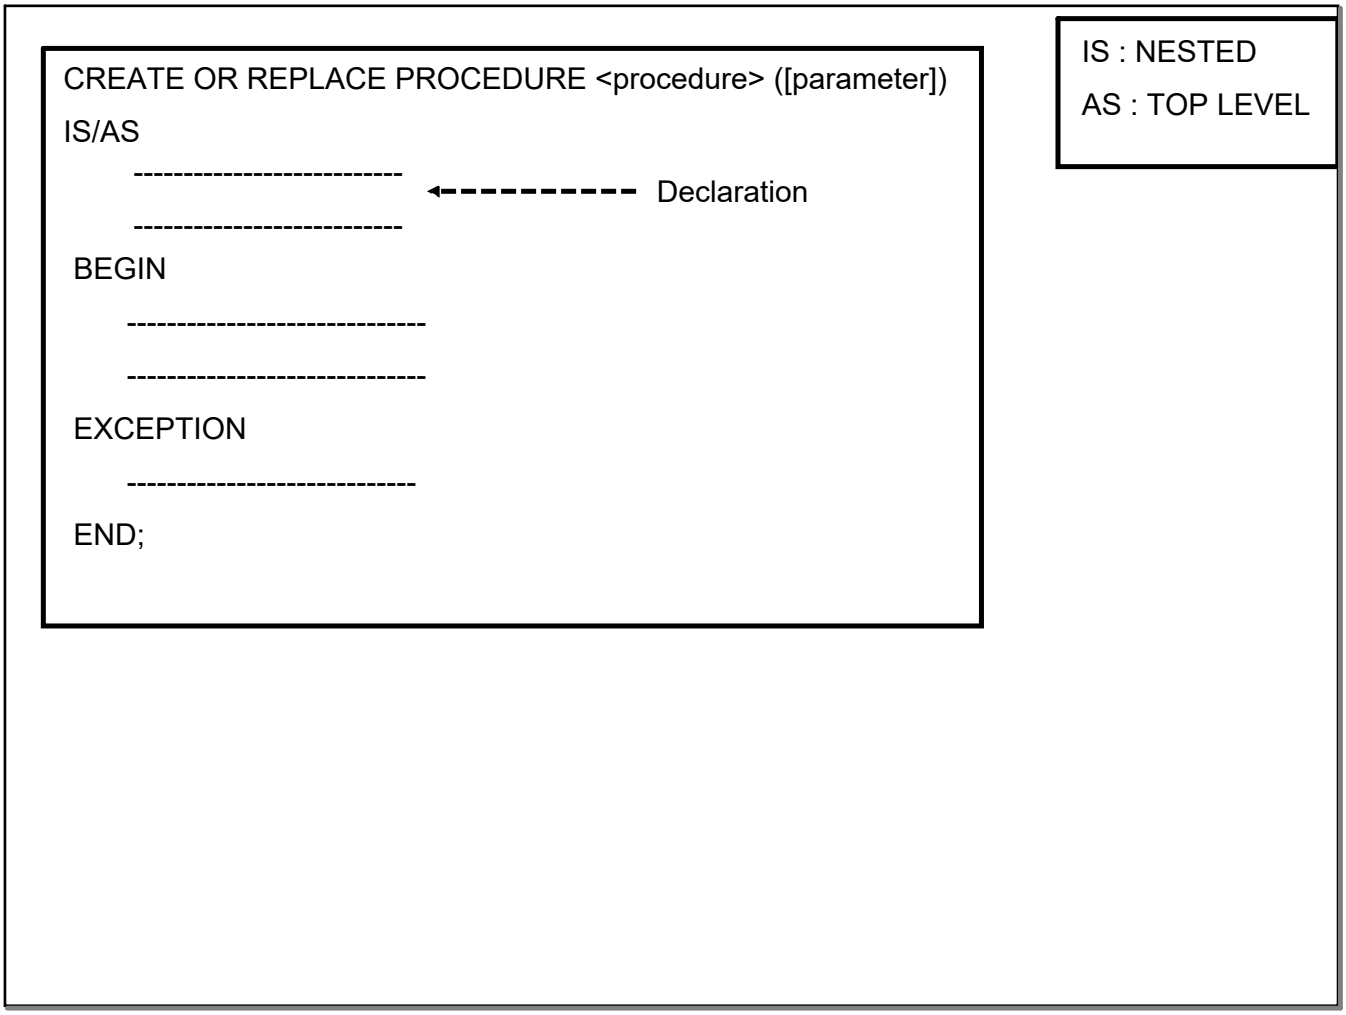
RETURN :

allow to return control back from sub-program

SUB-PROGRAM

PROCEDURE : Cannot return value using return stmt (OUT/INOUT)

FUNCTION : Can return values using return stmt (OUT/INOUT)



CREATE OR REPLACE PROCEDURE <procedure> ([parameter])
IS/AS

Declaration

BEGIN

EXCEPTION

END;
IS : NESTED
AS : TOP LEVEL

```
CREATE OR REPLACE FUNCTION <function name> ([parameter])
RETURN <datatype>
IS/AS----------------------------  <----------  Declaration
      ----------------------------
 BEGIN
      ------------------------------
      -------------------------------RETURN "";
 EXCEPTION
      ------------------------------
 END;
```

```
a = my_func() + b + c;
```

average | max | min

```
Employee employee; int max, int min; int avg;
statistics(avg, max, min, employee);  // calling stmt
  values will be available
```

```
create or replace procedure statistics(avg OUT number, max OUT number, min OUT
number, employee OUT employee)
AS
BEGIN
    select average(age) INTO avg from employee;
    IF avg = 0 THEN
        RETURN;
    END IF;
    select max(age) INTO max from employee;
    select min(age) INTO min from employee;
END statistics;
```

Writing the test cases for our classes/solution

unit test cases : MAX section : testing each functionality in isolation

integrated test : test the integration and relationship of a group of services

End-To-End : Complete application as client

JUnit - API : API to write the unit test cases for java codes

==> to organize the test cases

==> allow to test a given condition (Assertion)

Group of Testing APIs provided,

=>build on top of JUnit

=>compatible with JUnit

Assertion Based API :

assertj

hamcrest Matcher API

jayway (JSON)

skyscreamer (JSON)

TDD : Test Driven Development

For test cases to run, we need a runner : JUnit Runner

Mockito : MockitoRunner

Dependency needs to be mocked
need a Mock MVC

Mock : does not provide any default implementation of functionality
Spy : Does provide the default functionality , but can be simulated

```
fun(){
      if()
      --  abc()
      for()
      -- xyz()
      --
}
```

Not Recommended for writing test cases for private

=> powermock

powermock-api-mockito

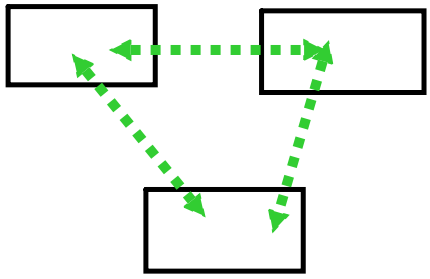
TDD :

AWS :

Regions : AWS service are region scoped

Clustors of Data Center : Availibility Zones

min 2 data center (3-6)



eg: Regions : us-east-1

us-east-1a

us-east-1b

us-east-1c

Putty : SSH Software allows to connect to an instance remotely

W10 : SSH support already available

>ssh -i .\MyVirtualServerKey.pem MyVirtualServer@54.87.217.81

> Permission : chmod 0400 ---

private IP : remains same on restart of EC2 instance

public IP : changes every time re-starts

elastic IP : does not changes on restart

EBS Volume:

EC2 instance is terminated : root volume (main drive) looses its data

Manual / Unexpected Termination

Elastic Block Store

Network Pen Drive (reusable)

USes network to communicate with EC2 instance (latency)

Bound to AZ

us-east-1a (EBS)

us-east-1b (cannot be connected)

EBS Volumes can be provisioned for GB, IOPS

4 types of EBS Volumes

GP2(SSD) : balanced price and performance(root)(1GB---16TB) 3IOPS/GB -- 16000IOPS

IOI (SSD) : High performing (root) (4GB-16TB) 100IOPS 64000IOPS

STI (HDD) : Low Cost , large workload , continous long running activities(500GB-16TB)

SCI (HDD) : Lowest Costing , less frequent access(500GB-16TB)

After Connecting to EC2 instance :

Mount it over Root Volume

AWS document : Mounting EBS Volume on Root Volume

Amazon S3 Service

infinitely scalable storage

Many aws services are integrated with S3

Allows to store Object (files) in buckets(directories)

Create a bucket under S3 Service : globally unique name

Naming Convention

: No uppercase

: No underscore

: 3-63 char

: no IP

: can start with lowercase or digit

Folder in bucket

root : upload a file : data.txt

path : s3://traininglti2020/data.txt

critical : folder

upload a file : test.txt

path : s3://traininglti2020/critical/test.txt

Object (file) : Max 5TB

Version : different version can be maintain for same object (key)

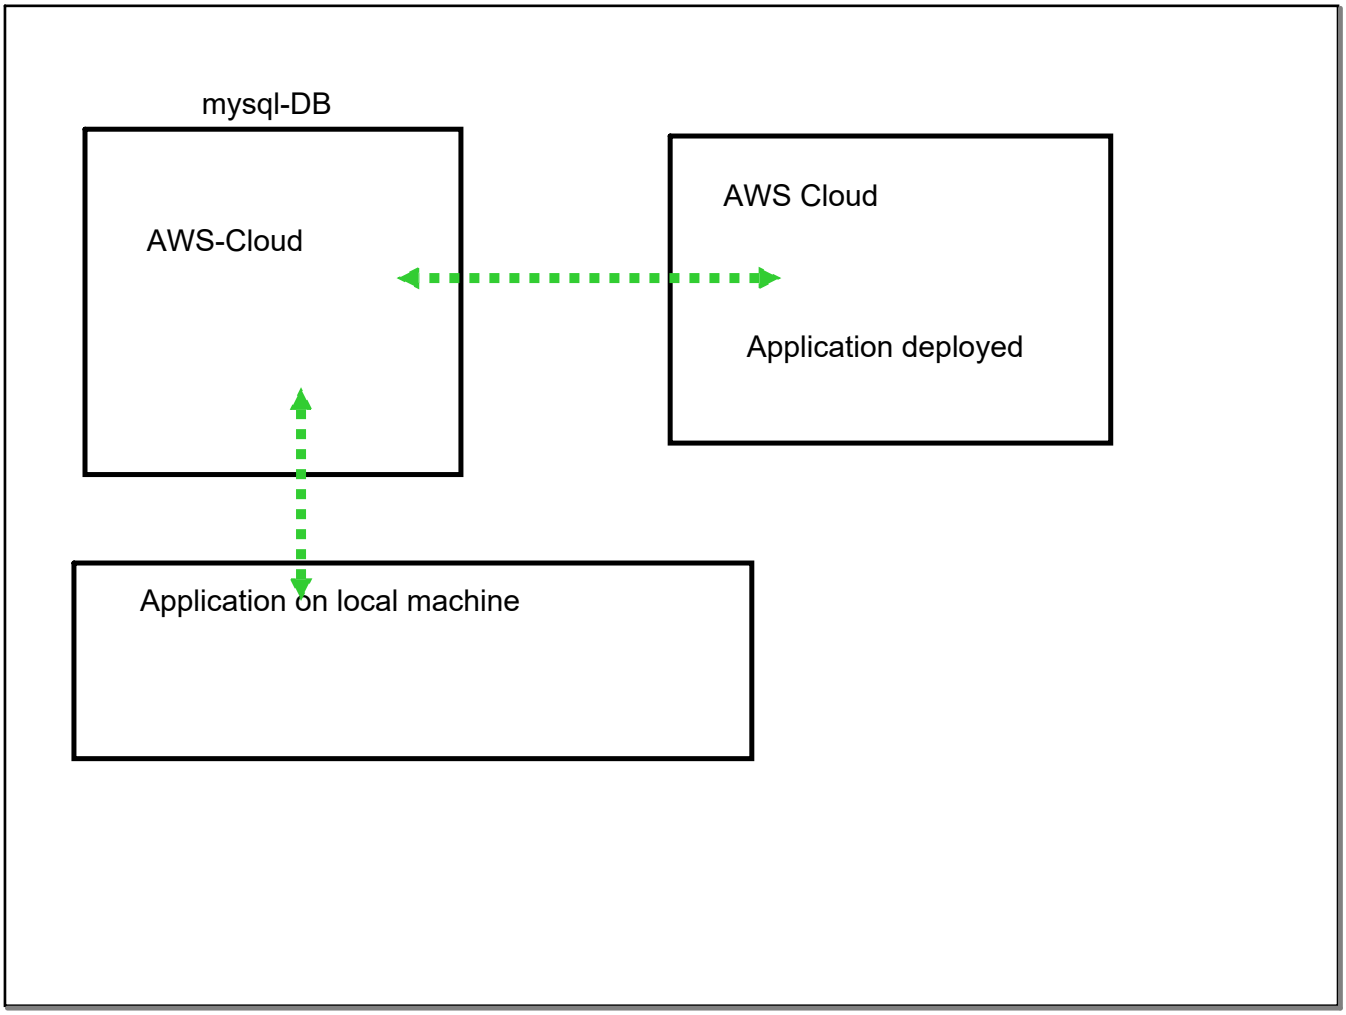
Reference to an object is through the key

s3://traininglti2020/critical/ : prefix

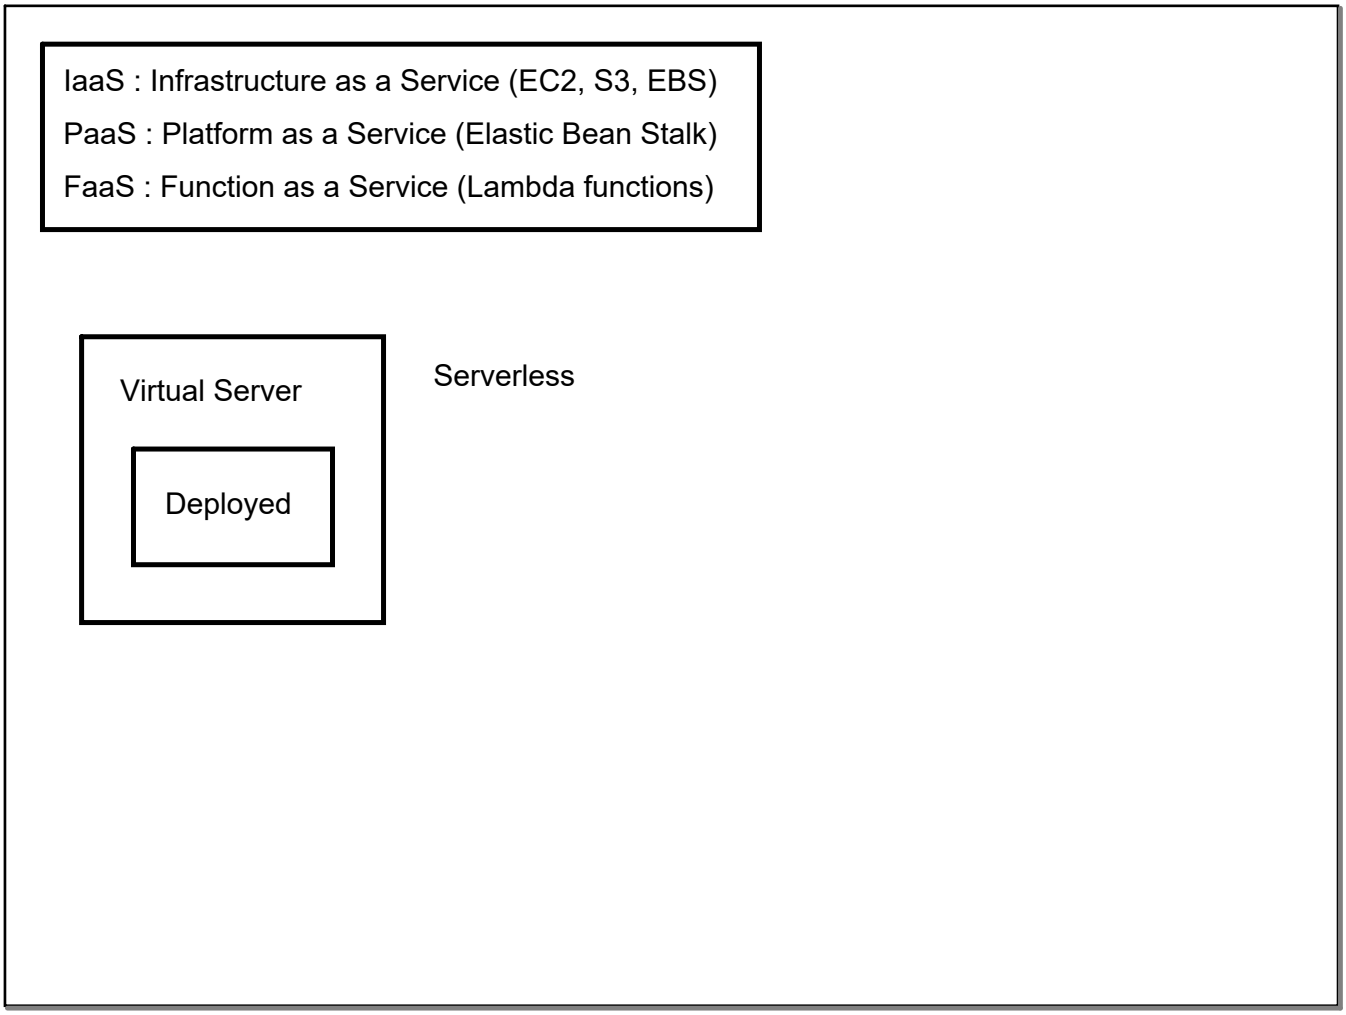
test.txt : object name

s3://traininglti2020.s3.amazonaws.com/h5d-sectioning-flowchart.png?versionId=XXkbcOEMHwtaeorTh5lLfFck0eNdN_mh

From amazon service



mysql-DB
AWS-Cloud
AWS Cloud
Application deployed
Application on local machine

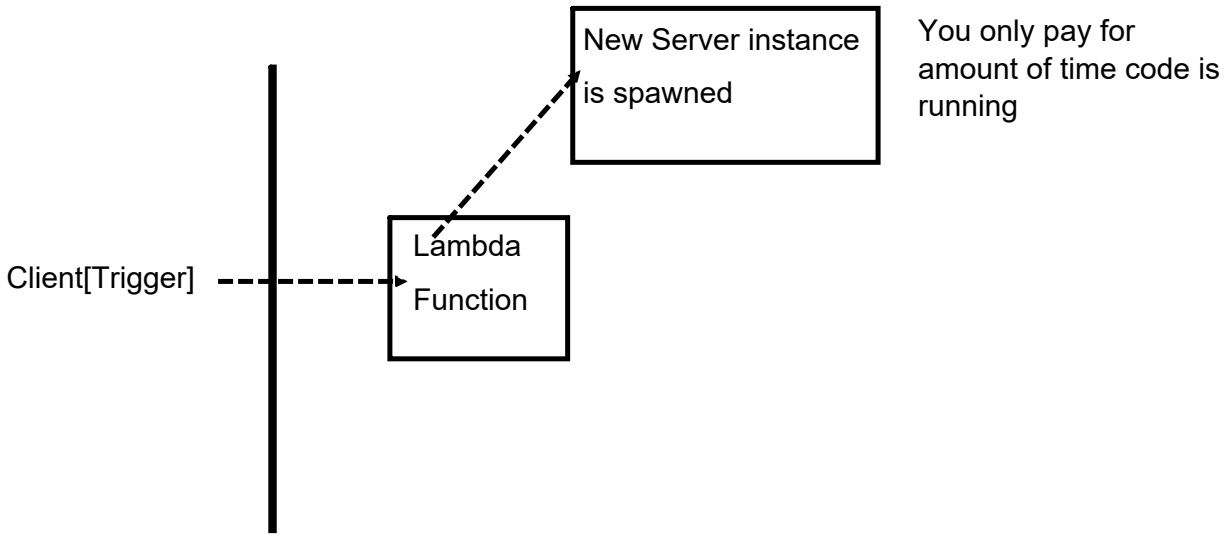


IaaS : Infrastructure as a Service (EC2, S3, EBS)
PaaS : Platform as a Service (Elastic Bean Stalk)
FaaS : Function as a Service (Lambda functions)
Virtual Server
Deployed
Serverless

New paradigm : no need to manage the server

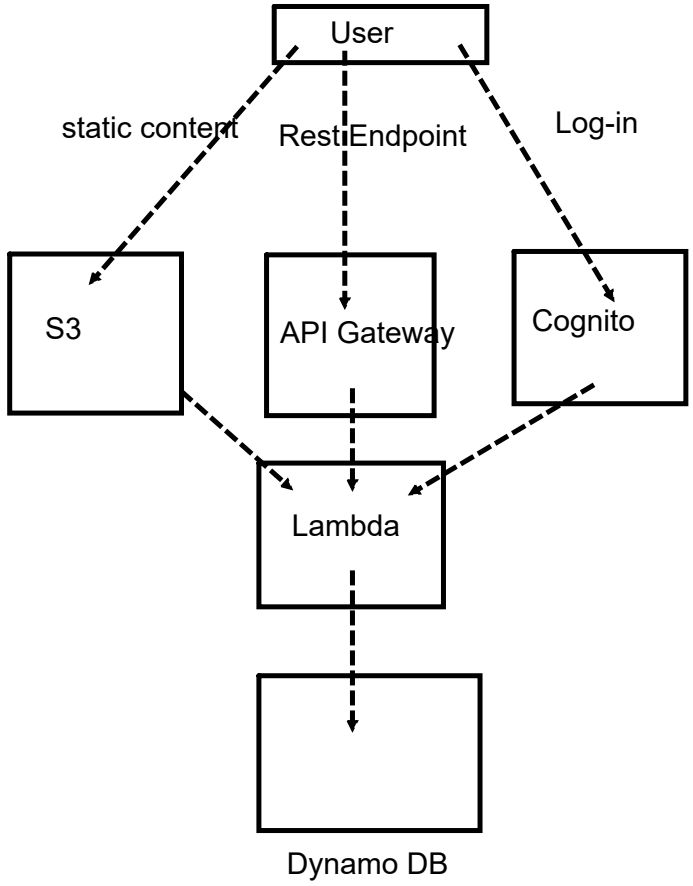
Deploy Code

Deploy function - lambda (Virtual Server --- database, messaging , storage



AWS - Serverless

Lambda
Dynamo DB
AWS API Gateway
S3
Aurora
Fargate
AWS Kinesis
Cognito

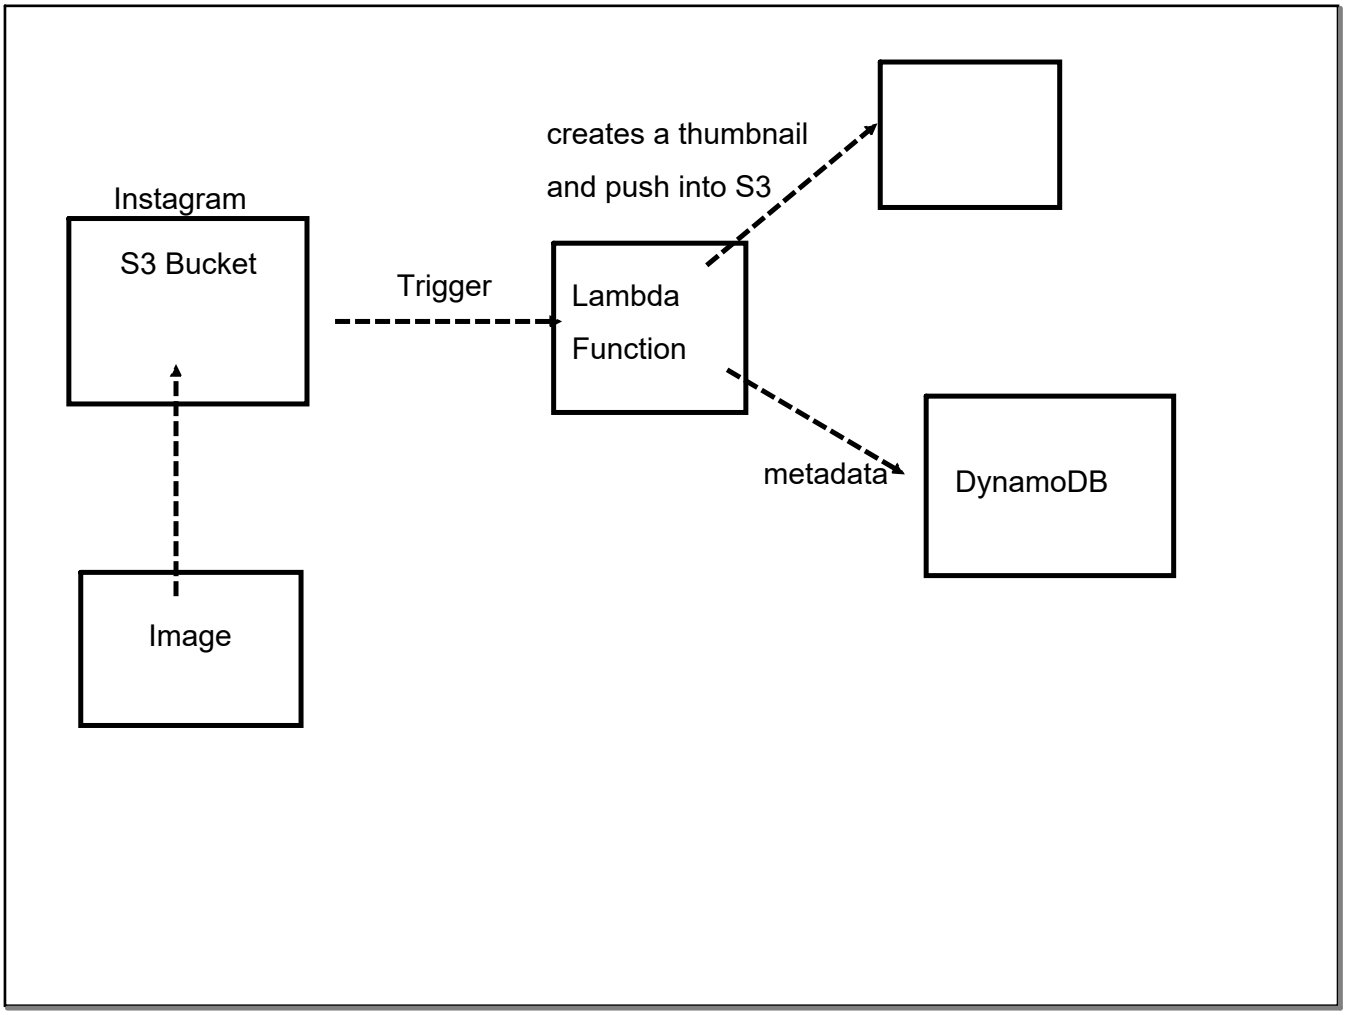


Lambda Function:

- NodeJS (Javascript)
- Python
- Java
- C#
- Ruby

Lambda : no Docker support right now

Fargate



creates a thumbnail
and push into S3
Instagram
S3 Bucket
Trigger
Lambda
Function
metadata
DynamoDB

CI/CD :

Jasmine API for writing unit test cases for JS

=> organize the test case

=> matchers : assert() ~ expect()

Jasmine needs a test runner : default test runner in angular app : Karma

spec.ts : test files

SetUp and Tear-Down

Every test case comprised of three section logically

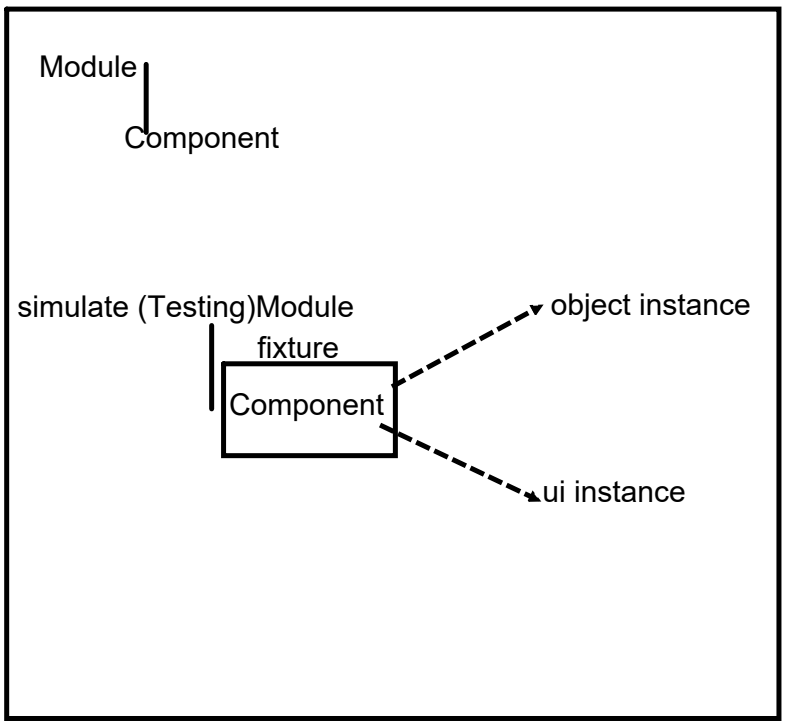
Arrange : initialize the system under test

Object creation, mock object creation, mocking method

Act : calling the method/function

Assert : to get the result

JaCoCo : for Java based test code-coverage



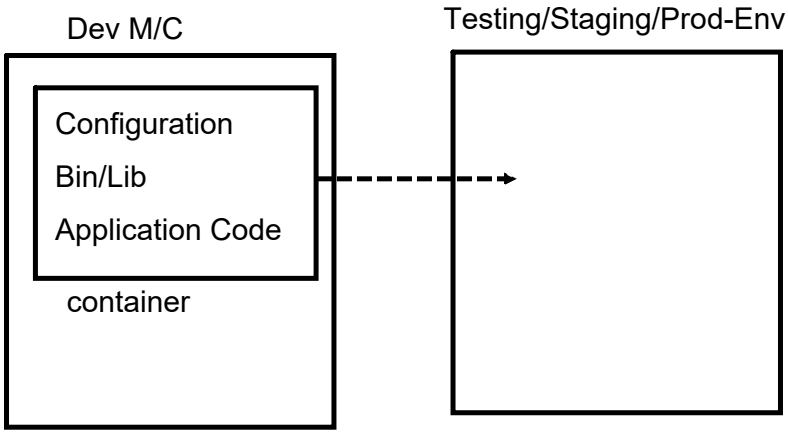
JEST : build on top of JASMINE (have its own test runner)

Docker : environment / platform to run application

Container Management Service

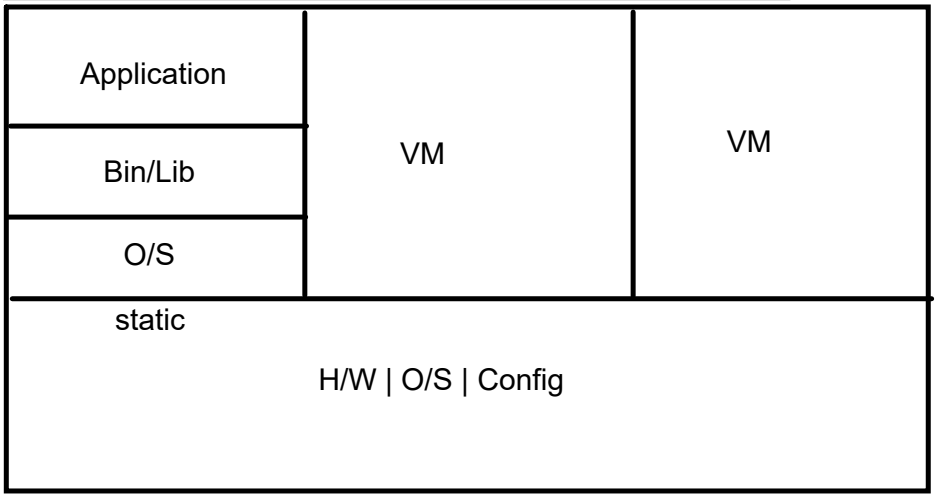
Problem : "Works on my machine"

Solution : Develop, ship and run anywhere



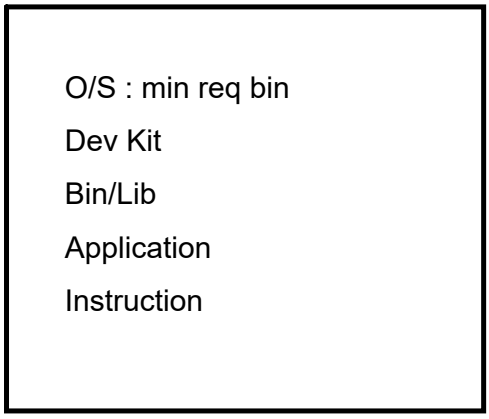
Virtual Machine on contrast to req of AGILE methodology

VM needs to be configured as per application continously



Container :

Create a Virtual Env for application



lightweight

Docker Container :

=> consume resources only when they are up and running (on the fly)

=> create multiple instances if required on the fly (highly scalable)

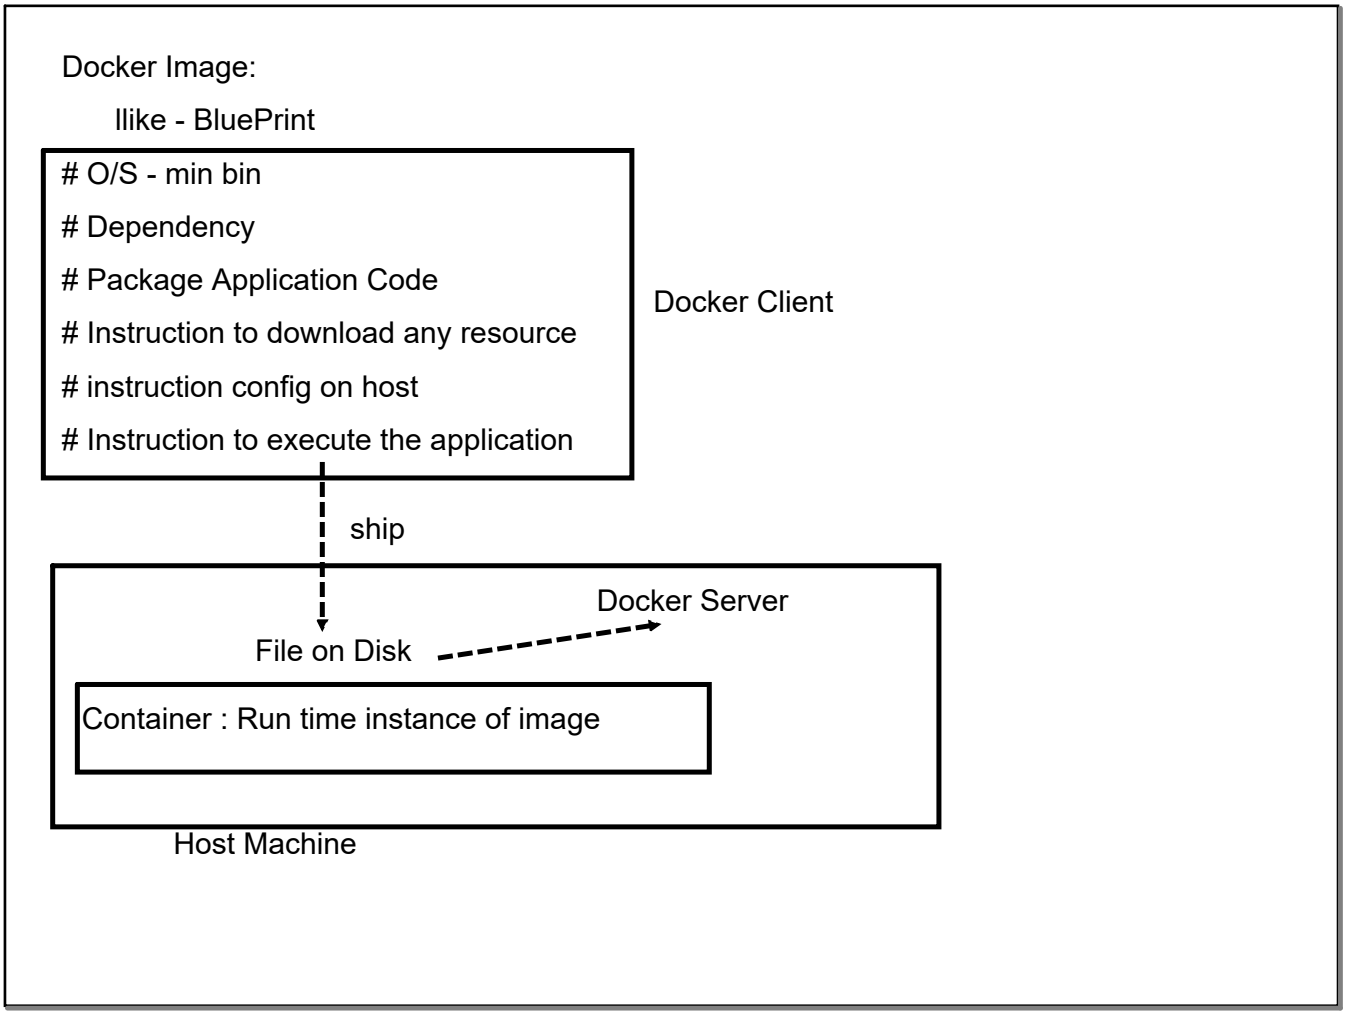
Docker Application

Docker Client

Docker Server (Engine)

Client : Allow to create Docker images

Server : Allow to Docker to launch the container on it



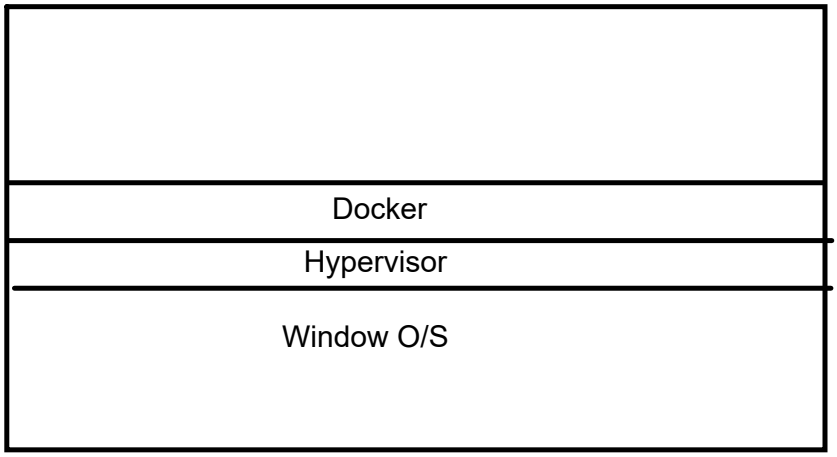
Docker Image:
Ilike - BluePrint
O/S - min bin
Dependency
Package Application Code
Instruction to download any resource
instruction config on host
Instruction to execute the application
Docker Client
ship
Docker Server
File on Disk
Container : Run time instance of image
Host Machine

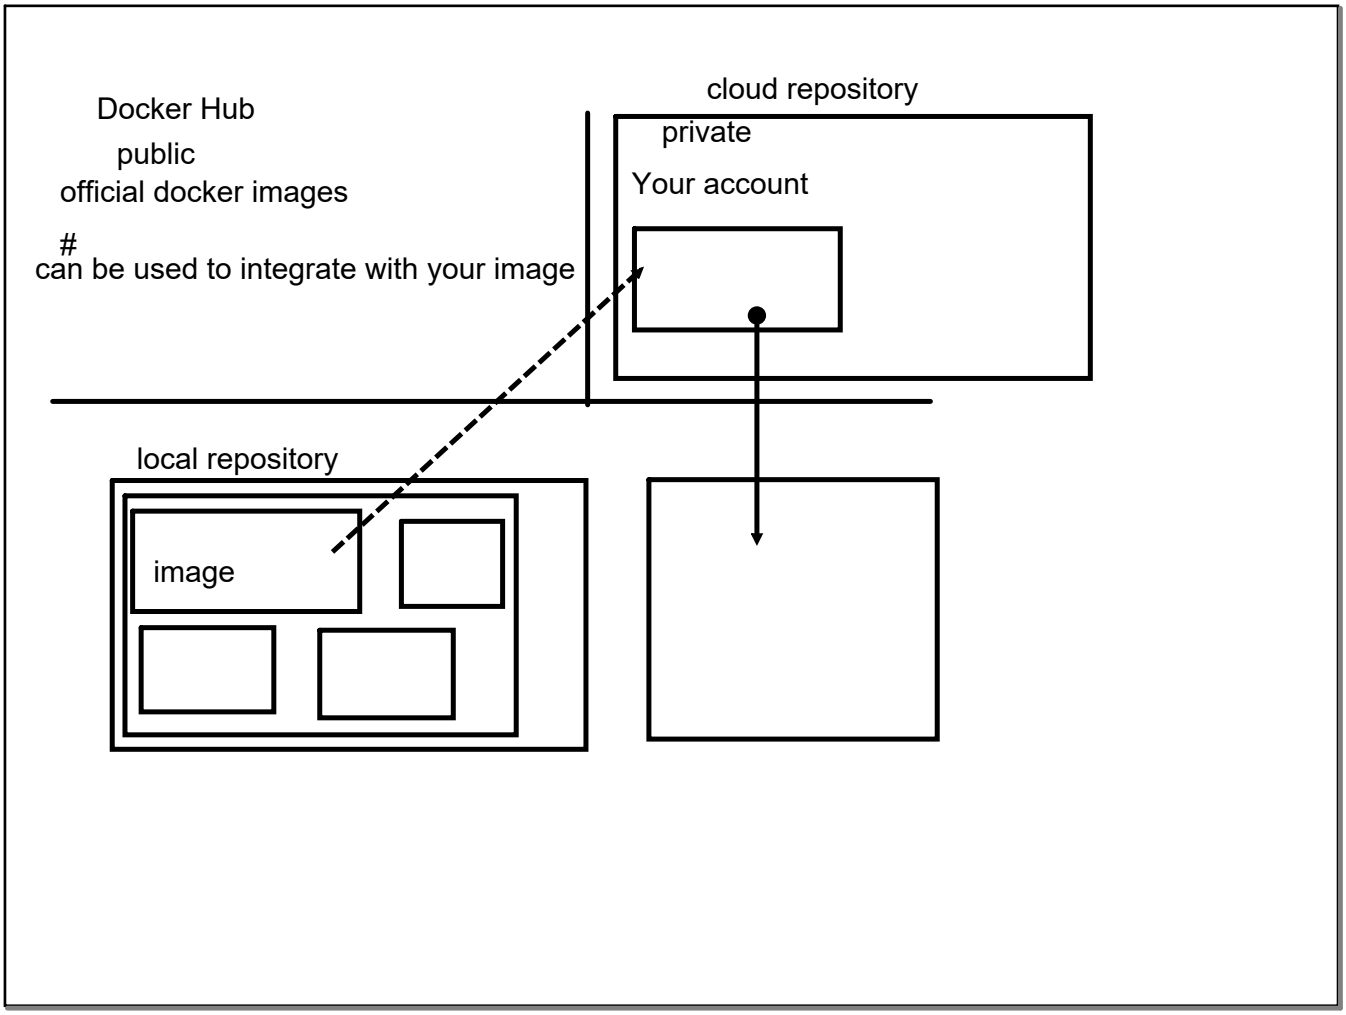
Virtualization must be enabled to install Docker

Docker Desktop APP

Client + Server

Docker Linux Based Application





Docker Hub
public
official docker images
#
can be used to integrate with your image
cloud repository
private
Your account
local repository
image

> docker images

List all docker images in local repo

> docker pull <image-name>

Pull (Fetch/download) image from Docker Hub

> docker container run <image name>

To launch container from an image

> docker container ls

Lists all the running containers

To Create a Docker image

: Create manifest file : Dockerfile

Contains instructions to create Docker images

Docker Manifest Command

FROM : which docker image to integrate with current

FROM <image-name>

RUN : runtime commands to execute when container is launched

RUN <command>

WORKDIR : move to a particular directory in your docker O/S

WORKDIR <dir>

COPY

Copy resources from local m/c file system to docker o/s file system

CMD

how to run application when container is ready

EXPOSE

port number on which app is running internally

Spring boot app to execute

1. Linux O/S
2. JRE

Bundle/ package in jar file

> image of Linux

> image of jre

> copy jar to docker O/S

> instruction to run application

Already image : min bin of Linux O/S installed with java 8
